RADIO, AUDIO AND ASSOCIATED SYSTEMS
BIPOLAR, MOS
TDA1512 TO μ A758

IC01b

RADIO, AUDIO AND ASSOCIATED SYSTEMS BIPOLAR, MOS

Part a

Selection guide

page

Functional index	5
Numerical index	17
Maintenance type list	31

General

Product status definition for type numbers with prefixes CA, MC, NE, SA, SE and μA	35
Ordering information for type numbers with prefixes CA, MC, NE, SA, SE and μA	36
Type designation for type numbers with prefixes HEF, MAB, MAF, OM, PCA, PCB, PCF, PNA, SAA, SAD, SAF, TDA, TDB, TDD, TEA and TSA	39
Rating systems	41
Handling MOS devices	43

Device data

CA3089 to TDA1510A

Part b

Selection guide

page

Functional index	953
Numerical index	965
Maintenance type list	979

Device data

TDA1512 to $\mu A758N$

Package information

Package outlines for prefixes CA, MC, NE, SA, SE and μA	1839
Package outlines for prefixes HEF, MAB, MAF, OM, PCA, PCB, PCF, PNA, SAA, SAD, SAF, TDA, TDB, TDD, TEA and TSA	1847

Soldering information

For type numbers with prefixes HEF, MAB, MAF, OM, PCA, PCB, PCF, PNA, SAA, SAD, SAF, TDA, TDB, TDD, TEA and TSA	1887

FUNCTIONAL INDEX

type no.	description	page
AMPLIFIERS		
NE542	dual low-noise preamplifier	91
NE5532	internally-compensated dual low noise operational amplifier	129
NE5532A	internally-compensated dual low noise operational amplifier	129
NE5533	dual and single low noise operational amplifier	135
NE5533A	dual and single low noise operational amplifier	135
NE5534	dual and single low noise operational amplifier	135
NE5534A	dual and single low noise operational amplifier	135
SA5534	dual and single low noise operational amplifier	135
SA5534A	dual and single low noise operational amplifier	135
SE5532	internally-compensated dual low noise operational amplifier	129
SE5532A	internally-compensated dual low noise operational amplifier	129
SE5534	dual and single low noise operational amplifier	135
SE5534A	dual and single low noise operational amplifier	135
TDA1010A	6 W audio power amplifier for in-car applications/10 W audio power amplifier for mains-fed applications	811
TDA1011	2 to 6 W audio power amplifier with preamplifier	829
TDA1013B	4 W audio power amplifier with DC volume control	841
TDA1015	1 to 4 W audio power amplifier with preamplifier	849
TDA1015T	0.5 W audio power amplifier with preamplifier	859
TDA1016	2 W recording/playback audio power amplifier with preamplifier, automatic level control, short-circuit and thermal protection	865
TDA1020	12 W audio power amplifier with preamplifier for car radios	871
TDA1510	24 W BTL or 2 x 12 W stereo car radio power amplifier	941
TDA1510A	24 W BTL or 2 x 12 W stereo car radio power amplifier	941
TDA1512	12 to 20 W hi-fi audio power amplifier	983
TDA1512Q	12 to 20 W hi-fi audio power amplifier	983
TDA1514A	50 W hi-fi power amplifier for digital audio (e.g. Compact Disc)	989
TDA1515B	24 W BTL or 2 x 12 W stereo car radio power amplifier	997
TDA1516Q	22 W BTL or 2 x 11 W stereo car radio power amplifier; closed loop voltage gain 26 dB	1003
TDA1517	2 x 6 W stereo car radio audio power amplifier (20 dB gain)	1011
TDA1518Q	22 W BTL or 2 x 11 W stereo car radio power amplifier; closed loop voltage gain 46 dB	1019
TDA1519	2 x 6 W stereo car radio audio power amplifier (40 dB gain)	1027
TDA1519A	22 W BTL or 2 x 11 W stereo car radio power amplifier	1035
TDA1519B	12 W BTL or 2 x 6 W stereo car radio power amplifier	1045
TDA1520B	20 W hi-fi audio power amplifier; complete SOAR protection	1055
TDA1520BQ	20 W hi-fi audio power amplifier; complete SOAR protection	1055
TDA1521	2 x 12 W hi-fi stereo audio power amplifier	1061
TDA1521A	2 x 6 W hi-fi stereo audio power amplifier	1071
TDA1521Q	2 x 12 W hi-fi stereo audio power amplifier	1061

FUNCTIONAL INDEX

type no.	description	page
TDA1522	stereo playback amplifier/equalizer with mute switch	1081
TDA1535	high-speed sample-and-hold amplifier	1125
TDA1579	traffic warning decoder circuit (AM carriers); ARI system	1231
TDA1579T	traffic warning decoder circuit (AM carriers); ARI system	1231
TDA1589	traffic control message and warning tone circuit; ARI system	1241
TDA2611A	5 W audio power amplifier	1305
TDA2613	6 W hi-fi audio power amplifier	1315
TDA7050	150 mW BTL or 2 x 75 mW stereo audio power amplifier; low voltage	1423
TDA7050T	150 mW BTL or 2 x 75 mW stereo audio power amplifier; low voltage	1427
TDA7052	1 W BTL mono audio amplifier for portable applications	1431
TDA7053	2 x 1 W BTL stereo audio power amplifier for portable applications	1437
AUDIO ICs		
Bus-controlled		
TDA8420	hi-fi stereo audio processor; I ² C-bus	1445
TDA8421	hi-fi stereo audio processor; I ² C-bus	1467
TDA8425	hi-fi stereo audio processor; I ² C-bus	1489
TEA6300	car radio preamplifier and source selector with sound and fader controls; I ² C-bus	1787
TEA6300T	car radio preamplifier and source selector with sound and fader controls; I ² C-bus	1787
TEA6310T	sound fader control circuit; I ² C-bus	1803
DC-controlled		
TDA1029	signal-source switch (4 x two channels)	877
TDA1074A	dual tandem electronic potentiometer circuit	931
TDA1524A	stereo tone/volume control circuit	1091
TDA1525	stereo tone/volume control circuit	1103
TDA1600	multi-function oscillator switch for audio cassette recorders	1293
TDA3810	spatial, stereo and pseudo-stereo sound circuit	1335
TDD1601	equalizer for audio cassette recorders	1589
CLOCK/CALENDAR		
PCF8573	clock calendar; I ² C-bus	329
PCF8583	clock calendar with 256 x 8-bit static RAM; I ² C-bus	491
COMPANDOR		
NE570	compandor	95
NE571	compandor	95
NE572	programmable analogue compandor	103
NE575	low voltage compandor	111
SA571	compandor	95
SA572	programmable analogue compandor	103

type no.	description	page
----------	-------------	------

DATA CONVERSION

ADCs, DACs

MC3410	10-bit high-speed multiplying DAC	83
MC3410C	10-bit high-speed multiplying DAC	83
MC3510	10-bit high-speed multiplying DAC	83
NE5410	10-bit high-speed multiplying DAC	119
PCF8591	8-bit ADC/DAC; I ² C-bus	509
PNA7509	7-bit ADC; 22 MHz; 3-state output	527
PNA7518	8-bit multiplying DAC; 30 MHz	539
SAA7320	stereo DAC for Compact Disc	757
SE5410	10-bit high-speed multiplying DAC	119
TDA1534	14-bit ADC	1117
TDA1541A	dual 16-bit DAC	1129
TDA1543	dual 16-bit economy DAC (I ² S bus format)	1145
TDA8444	octuple 6-bit DAC; I ² C-bus	1511

DIGITAL AUDIO

Compact Disc

SAA7210	decoder for Compact Disc (second generation)	671
SAA7220	digital filter and interpolator for Compact Disc (second generation)	693
SAA7310	decoder for Compact Disc (third generation)	727
SAA7320	stereo DAC for Compact Disc	757
SAD7630	CCD delay line for error correction in video and sound carrier timebases (laservision players)	777
TDA1514A	50 W hi-fi power amplifier for digital audio (e.g. Compact Disc)	989
TDA1541A	dual 16-bit DAC	1129
TDA1542	active element for post filtering (dual channel)	1137
TDA1543	dual 16-bit economy DAC (I ² S bus format)	1145
TDA5708	photo diode signal processor for Compact Disc single-spot read-out systems	1347
TDA5709	radial error signal processor for Compact Disc	1367
TDA8808T	photo diode signal processor for Compact Disc	1519
TDA8808AT	photo diode signal processor for Compact Disc	1519
TDA8808T/AT	transfer functions	1539
TDA8809T	radial error signal processor for Compact Disc	1559
TDA8809T	transfer functions	1571

Input circuits

SAA7274	audio digital input circuit (ADIC)	715
TDA1542	active element for post filtering (dual channel)	1137

FUNCTIONAL INDEX

type no.	description	page
DISPLAY DRIVERS		
PCF1303T	18-element bar graph LCD driver (with analogue input)	223
PCF2100	LCD duplex driver; 40 segments	229
PCF2110	LCD duplex driver; 60 segments and 2 LEDs	229
PCF2111	LCD duplex driver; 64 segments	229
PCF2112	LCD driver; 32 segments	229
PCF2201	LCD flat panel row/column driver	245
PCF8566	universal LCD driver for low multiplex rates (1:1 to 1:4); max. 96 elements; I ² C-bus	289
PCF8576	universal LCD driver for low multiplex rates (1:1 to 1:4); max. 160 segments; I ² C-bus	359
PCF8577	LCD direct driver (32 segments) or duplex driver (64 segments); I ² C-bus	393
PCF8577A	LCD direct driver (32 segments) or duplex driver (64 segments); I ² C-bus; different slave address	393
PCF8578	LCD row/column driver for dot matrix graphic displays; 40 outputs, of which 24 are programmable; I ² C-bus	409
PCF8579	LCD column driver for dot matrix graphic displays; 40 column outputs; I ² C-bus	447
SAA1064	4-digit LED driver; I ² C-bus	555
DOLBY CIRCUITS		
NE645	Dolby B and C type noise reduction circuit	179
NE646	Dolby B and C type noise reduction circuit	179
NE649	low voltage Dolby B type noise reduction circuit	185
NE650	Dolby B type noise reduction circuit	191
NE5240	Dolby digital audio decoder	115
TEA0651	Dolby B & C noise reduction circuit	1627
TEA0652	Dolby B & C noise reduction circuit	1627
TEA0653T	stereo or 2-channel Dolby B noise reduction circuit	1645
TEA0654	preamplifier and electronic switch for Dolby B & C noise reduction circuits	1627
TEA0657	dual Dolby B noise reduction circuit	1651
TEA0665	Dolby B & C processor with preamplifier and electronic switch	1659
TEA0665T	Dolby B & C processor with preamplifier and electronic switch	1659
TEA0666	Dolby B & C processor with preamplifier and electronic switch; changed frequency response in relation to TEA0665	1669
TEA0666T	Dolby B & C processor with preamplifier and electronic switch; changed frequency response in relation to TEA0665	1669
TEA0670T	Dolby B & C processor with preamplifier and electronic switch; low voltage	1679
FREQUENCY SYNTHESIZERS		
HEF4750V	frequency synthesizer	53
SAA1057	radio tuning PLL frequency synthesizer (SYMO II)	545
TDD1742T	low power frequency synthesizer (LOPSY)	1605
TSA6057	radio tuning PLL frequency synthesizer; I ² C-bus	1821
TSA6057T	radio tuning PLL frequency synthesizer; I ² C-bus	1821

type no.	description	page
INTERFERENCE SUPPRESSORS		
TDA1001B	interference and noise suppression circuit for FM receivers	801
TDA1001BT	interference and noise suppression circuit for FM receivers	801
MEMORIES		
PCF8570	256 x 8-bit static RAM; I ² C-bus	319
PCF8570C	256 x 8-bit static RAM; I ² C-bus; different slave address	319
PCF8571	128 x 8-bit static RAM; I ² C-bus	319
PCF8582A	256 x 8-bit EEPROM; I ² C-bus; -40 to +85 °C	481
MICROCONTROLLERS (8-bit)		
8051/80C51 family CMOS		
PCA80C31BH-3	microcontroller; 128 x 8 RAM; 1.2 to 12 MHz; -40 to +125 °C	209
PCA80C51BH-3	microcontroller; 128 x 8 RAM; 4K x 8 ROM; 1.2 to 12 MHz; -40 to +125 °C	209
PCA80C552	microcontroller; 256 x 8 RAM; 80C31 CPU plus 16-bit capture/compare timer/counter; watch-dog timer; 2 pulse-width modulated signals; 10-bit ADC with 8 multiplexed input lines; I ² C-bus; 1.2 to 12 MHz; -40 to +125 °C	213
PCA80C562	microcontroller; 256 x 8 RAM; 80C31 CPU plus 16-bit capture/compare timer/counter; watch-dog timer; 2-pulse-width modulated signals; 8-bit ADC with 8 multiplexed input lines; 1.2 to 12 MHz; -40 to +125 °C	215
PCA80C652	microcontroller; 256 x 8 RAM; serial I/O; UART; I ² C-bus; 1.2 to 12 MHz; -40 to +125 °C	217
PCA83C552	microcontroller; 256 x 8 RAM; 8K x 8 ROM; 80C51 CPU plus 16-bit capture/compare timer/counter; watch-dog timer; 2 pulse-width modulated signals; 10-bit ADC with 8 multiplexed input lines; I ² C-bus; 1.2 to 12 MHz; -40 to +125 °C	213
PCA83C562	microcontroller; 256 x 8 RAM; 8K x 8 ROM; 80C51 CPU plus 16-bit capture/compare timer/counter; watch-dog timer; 2-pulse-width modulated signals; 8 multiplexed input lines; 1.2 to 12 MHz; -40 to +125 °C	215
PCA83C652	microcontroller; 256 x 8 RAM; 8K x 8 ROM; serial I/O; UART; I ² C-bus; 1.2 to 12 MHz; -40 to +125 °C	217
PCA83C654	microcontroller; 256 x 8 RAM; 16K x 8 ROM; serial I/O; UART; I ² C-bus; 1.2 to 12 MHz; -40 to +125 °C	219
PCB80C31BH-3	microcontroller; 128 x 8 RAM; 0.5 to 12 MHz; 0 to +70 °C	209
PCB80C31BH-3	microcontroller; 128 x 8 RAM; 1.2 to 16 MHz; 0 to +70 °C	209
PCB80C51BH-3	microcontroller; 128 x 8 RAM; 4K x 8 ROM; 0.5 to 12 MHz; 0 to +70 °C	209
PCB80C51BH-3	microcontroller; 128 x 8 RAM; 4K x 8 ROM; 1.2 to 16 MHz; 0 to +70 °C	209

FUNCTIONAL INDEX

PCF83C851	microcontroller; 128 x 8 RAM; 4K x 8 ROM; 256 x 8 EEPROM; 1.2 to 12 MHz; -40 to +85 °C	221
84CXX family CMOS		
PCF84C00	microcontroller; 256 x 8 RAM; bond-out version PCF84CXX family; I ² C-bus	283
PCF84C12	low cost microcontroller; 64 x 8 RAM; 1K x 8 ROM	285
PCF84C21	microcontroller; 64 x 8 RAM; 2K x 8 ROM; plus 8-bit LED driver; I ² C-bus; -40 to +85 °C	283
PCF84C22	low cost microcontroller; 64 x 8 RAM; 1K x 8 ROM	285
PCF84C41	microcontroller; 128 x 8 RAM; 4K x 8 ROM; plus 8-bit LED driver; I ² C-bus; -40 to +85 °C	283
PCF84C42	low cost microcontroller; 64 x 8 RAM; 4K x 8 ROM	285
PCF84C81	microcontroller; 256 x 8 RAM; 8K x 8 ROM; plus 8-bit LED driver; I ² C-bus; -40 to +85 °C	283
PCF84C85	microcontroller; 256 x 8 RAM; 8K x 8 ROM; 32 I/O; plus 8-bit LED driver; I ² C-bus; -40 to +85 °C	287
84XX family NMOS		
MAB8401	microcontroller; 128 x 8 RAM; piggy-back version for MAB84XX family plus 8-bit LED driver; I ² C-bus; 1.0 to 6 MHz; 0 to +70 °C	79
MAB8411	microcontroller; 64 x 8 RAM; 1K x 8 ROM plus 8-bit LED driver; 20 I/O lines; I ² C-bus; 1.0 to 6 MHz; 0 to +70 °C	79
MAB8421	microcontroller; 64 x 8 RAM; 2K x 8 ROM plus 8-bit LED driver; 20 I/O lines; I ² C-bus; 1.0 to 6 MHz; 0 to +70 °C	79
MAB8422	microcontroller; 64 x 8 RAM; 2K x 8 ROM plus 8-bit LED driver; 15 I/O lines; I ² C-bus; 1.0 to 6 MHz; 0 to +70 °C	81
MAB8441	microcontroller; 128 x 8 RAM; 4K x 8 ROM plus 8-bit LED driver; 20 I/O lines; I ² C-bus; 1.6 to 6 MHz; 0 to +70 °C	79
MAB8442	microcontroller; 128 x 8 RAM; 4K x 8 ROM plus 8-bit LED driver; 15 I/O lines; I ² C-bus; 1.6 to 6 MHz; 0 to +70 °C	81
MAB8461	microcontroller; 128 x 8 RAM; 6K x 8 ROM plus 8-bit LED driver; 20 I/O lines; I ² C-bus; 1.0 to 6 MHz; 0 to +70 °C	79

84XX family NMOS (continued)		
MAF84A11	microcontroller; 64 x 8 RAM; 1K x 8 ROM; plus 8-bit LED driver; 20 I/O lines; I ² C-bus; 1.0 to 5 MHz; -40 to +110 °C	79
MAF84A21	microcontroller; 64 x 8 RAM; 2K x 8 ROM plus 8-bit LED driver; 20 I/O lines; I ² C-bus; 1.0 to 5 MHz; -40 to +110 °C	79
MAF84A22	microcontroller; 64 x 8 RAM; 2K x 8 ROM plus 8-bit LED driver; 15 I/O lines; I ² C-bus; 1.0 to 5 MHz; -40 to +110 °C	81
MAF84A41	microcontroller; 128 x 8 RAM; 4K x 8 ROM plus 8-bit LED driver; 20 I/O lines; I ² C-bus; 1.0 to 5 MHz; -40 to +110 °C	79
MAF84A42	microcontroller; 128 x 8 RAM; 4K x 8 ROM plus 8-bit LED driver; 15 I/O lines; I ² C-bus; 1.0 to 5 MHz; -40 to +110 °C	81
MAF84A61	microcontroller; 128 x 8 RAM; 6K x 8 ROM plus 8-bit LED driver; 20 I/O lines; I ² C-bus; 1.0 to 5 MHz; -40 to +110 °C	79
MAF8411	microcontroller; 64 x 8 RAM; 1K x 8 ROM plus 8-bit LED driver; 20 I/O lines; I ² C-bus; 1.0 to 6 MHz; -40 to +85 °C	79
MAF8421	microcontroller; 64 x 8 RAM; 2K x 8 ROM plus 8-bit LED driver; 20 I/O lines; I ² C-bus; 1.0 to 6 MHz; -40 to +85 °C	79
MAF8422	microcontroller; 64 x 8 RAM; 2K x 8 ROM plus 8-bit LED driver; 15 I/O lines; I ² C-bus 1.0 to 6 MHz; -40 to +85 °C	81
MAF8441	microcontroller; 128 x 8 RAM; 4K x 8 ROM plus 8-bit LED driver; 20 I/O lines; I ² C-bus; 1.0 to 6 MHz; -40 to +85 °C	79
MAF8442	microcontroller; 128 x 8 RAM; 4K x 8 ROM plus 8-bit LED driver; 15 I/O lines; I ² C-bus; 1.0 to 6 MHz; -40 to +85 °C	81
MAF8461	microcontroller; 128 x 8 RAM; 6K x 8 ROM plus 8-bit LED driver; 20 I/O lines; I ² C-bus; 1.0 to 6 MHz; -40 to +85 °C	79
8048 family CMOS		
PCA80C39	microcontroller; 128 x 8 RAM; 1.0 to 15 MHz; -40 to +110 °C	211
PCA80C49	microcontroller; 128 x 8 RAM; 2K x 8 ROM; 1.0 to 15 MHz; -40 to +110 °C	211
PCB80C39	microcontroller; 128 x 8 RAM; 1.0 to 15 MHz; 0 to +70 °C	211
PCB80C49	microcontroller; 128 x 8 RAM; 2K x 8 ROM; 1.0 to 15 MHz; 0 to +70 °C	211
PCF80C39	microcontroller; 128 x 8 RAM; 1.0 to 15 MHz; -40 to +85 °C	211
PCF80C49	microcontroller; 128 x 8 RAM; 2K x 8 ROM; 1.0 to 15 MHz; -40 to +85 °C	211

type no.	description	page
MOTOR CONTROLLERS		
TDA1059B	motor speed regulator with thermal shut-down; multiplication coefficient = 9; drop-out voltage = 1.8 V	891
TDA5040T	DC motor drive circuit with magnetic-field detector	1339
PERSONAL RADIO/AUDIO		
TDA7000	FM radio circuit; mono (in plastic DIL-18)	1381
TDA7010T	FM radio circuit; mono (in SO-16 plastic mini-pack)	1389
TDA7021T	FM radio circuit; stereo/mono; for low voltage micro tuning system (MTS)	1397
TDA7030T	low voltage micro tuning system (MTS)	1407
TDA7040T	PLL stereo decoder; low voltage	1415
TDA7050	150 mW BTL or 2 x 75 mW stereo audio power amplifier; low voltage	1423
TDA7050T	150 mW BTL or 2 x 75 mW stereo audio power amplifier; low voltage	1427
TDA7052	1 W BTL mono audio amplifier for portable applications	1431
TDA7053	2 x 1 W BTL stereo audio power amplifier for portable applications	1437
TEA0670T	Dolby B & C processor preamplifier and electronic switch; low voltage	1679
TEA5551T	single-chip AM radio circuit, plus dual AF amplifier, for pocket receivers with headphones	1685
RADIO RECEIVERS		
AM		
TDA1072A	AM receiver circuit for hi-fi and car radio	897
TDA1072AT	AM receiver circuit for hi-fi and car radio	913
TDA1572	AM receiver circuit for stereo hi-fi and car radio	1153
TDA1572T	AM receiver circuit for stereo hi-fi and car radio	1171
TDB1080	IF limiting amplifier, FM detector and audio amplifier	1583
TDB1080T	IF limiting amplifier, FM detector and audio amplifier	1583
TEA6200	AM upconversion radio receiver; 10.7 MHz IF	1775
AM/FM		
TEA5570	AM/FM radio receiver circuit	1697
TEA5591	AM/FM radio receiver circuit	1733
FM		
CA3089	FM IF system	47
NE604A	high performance low-power FM IF system	149
NE605	low-power FM IF system	159
NE614A	low-power FM IF system	169
SA604A	high performance low-power FM IF system	149
SA605	low-power FM IF system	159
SA614A	low-power FM IF system	169
TDA1574	integrated FM tuner for radio receivers	187
TDA1574T	integrated FM tuner for radio receivers	1195
TDA1576	FM/IF amplifier and detector	1205

FUNCTIONAL INDEX

type no.	description	page
FM (continued)		
TDA1596	FM/IF amplifier and detector	1249
TDA1596T	FM/IF amplifier and detector	1267
TDA7000	FM radio circuit; mono (in plastic DIL-18)	1381
TDA7010T	FM radio circuit; mono (in SO-16 plastic mini-pack)	1389
TDA7021T	FM radio circuit; stereo/mono; for low voltage micro tuning system (MTS)	1397
TEA6100	FM/IF system and microcomputer-based tuning interface; I ² C-bus	1751
REMOTE CONTROLLERS		
SAA3004	high performance transmitter (455 kHz) for infrared remote control; up to 448 commands	585
SAA3006	high performance transmitter (RC-5) for infrared remote control; up to 2048 commands	595
SAA3007	high performance transmitter (455 kHz) for infrared remote control; up to 1280 commands; low voltage	609
SAA3008	high performance transmitter (38 kHz) for infrared remote control; low voltage	623
SAA3009	infrared remote control decoder; decodes 64 commands (RECS80/RC-5); up to 32 subaddresses; high current output capability for direct LED drive	637
SAA3010	high-performance transmitter (RC-5) for infrared remote control; low voltage	647
SAA3028	high performance transcoder (RC-5) for infrared remote control; I ² C-bus	663
SAA3049	infrared remote control decoder, low current version of SAA3009	637
SAF1032	receiver/decoder for infrared remote control	787
SAF1039	transmitter for infrared remote control	787
TDA3047	high performance receiver for infrared remote control; positive output voltage	1323
TDA3048	high performance receiver for infrared remote control; negative output voltage	1329
REMOTE I/O EXPANDERS		
PCF8574	remote 8-bit I/O expander; I ² C-bus	347
PCF8574A	remote 8-bit I/O expander; I ² C-bus; different slave address	347
SOUND GENERATOR		
SAA1099	stereo sound generator for sound effects and music synthesis (μ C-controlled)	565
SPEECH SYNTHESIZERS		
OM8200	speech demonstration board (PCF8200)	197
OM8201	speech demonstration box (PCF8200)	201
OM8209	update package for OM8010	203
OM8210	speech analysis/editing system (PCF8200)	205
PCF8200	voice synthesizer (CMOS); I ² C-bus	267

type no.	description	page
STEREO DECODERS		
TDA1578A	time multiplex PLL stereo decoder for hi-fi and car radios	1217
TDA1598	time multiplex PLL stereo decoder for hi-fi and car radios	1285
TDA7040T	PLL stereo decoder; low voltage	1415
TEA5580	PLL stereo decoder for medium-fi and car radios	1711
TEA5581	PLL stereo decoder with source selector switch for medium-fi and car radios	1721
TEA5581T	PLL stereo decoder with source selector switch for medium-fi and car radios	1721
TSA6057	radio tuning PLL frequency synthesizer; I ² C-bus	1821
TSA6057T	radio tuning PLL frequency synthesizer; I ² C-bus	1821
μA758	FM stereo multiplex decoder; PLL	1831
TUNING CIRCUITS		
HEF4750V	frequency synthesizer	53
HEF4751V	universal divider	69
NE602	double-balanced mixer and oscillator	143
NE612	double balanced mixer and oscillator	163
SA602	double-balanced mixer and oscillator	143
SAA1057	radio tuning PLL frequency synthesizer (SYMO II)	545
SAA1300	tuner switching circuit; I ² C-bus	581
TDA1574	integrated FM tuner for radio receivers	1187
TDA1574T	integrated FM tuner for radio receivers	1195
TDA7030T	low voltage micro tuning system (MTS)	1407
TDD1742T	low power frequency synthesizer (LOPSY)	1605

NUMERICAL INDEX

type no.	description	page
CA3089N	FM IF system	47
HEF4750VD	frequency synthesizer	53
HEF4750VU	frequency synthesizer	53
HEF4751VD	universal divider	69
HEF4751VP	universal divider	69
HEF4751VT	universal divider	69
HEF4751VU	universal divider	69
MAB8401B	microcontroller; 128 x 8 RAM; piggy-back version for MAB84XX family plus 8-bit LED driver; I ² C-bus; 1.0 to 6 MHz; 0 to +70 °C	79
MAB8401WP	microcontroller; 128 x 8 RAM; piggy-back version for MAB84XX family plus 8-bit LED driver; I ² C-bus; 1.0 to 6 MHz; 0 to +70 °C	79
MAB8411P	microcontroller; 64 x 8 RAM; 1K x 8 ROM plus 8-bit LED driver; 20 I/O lines; I ² C-bus; 1.0 to 6 MHz; 0 to +70 °C	79
MAB8411T	microcontroller; 64 x 8 RAM; 1K x 8 ROM plus 8-bit LED driver; 20 I/O lines; I ² C-bus; 1.0 to 6 MHz; 0 to +70 °C	79
MAB8421P	microcontroller; 64 x 8 RAM; 2K x 8 ROM plus 8-bit LED driver; 20 I/O lines; I ² C-bus; 1.0 to 6 MHz; 0 to +70 °C	79
MAB8421T	microcontroller; 64 x 8 RAM; 2K x 8 ROM plus 8-bit LED driver; 20 I/O lines; I ² C-bus; 1.0 to 6 MHz; 0 to +70 °C	79
MAB8422P	microcontroller; 64 x 8 RAM; 2K x 8 ROM plus 8-bit LED driver; 15 I/O lines; I ² C-bus; 1.0 to 6 MHz; 0 to +70 °C	81
MAB8441P	microcontroller; 128 x 8 RAM; 4K x 8 ROM plus 8-bit LED driver; 20 I/O lines; I ² C-bus; 1.0 to 6 MHz; 0 to +70 °C	79
MAB8441T	microcontroller; 128 x 8 RAM; 4K x 8 ROM plus 8-bit LED driver; 20 I/O lines; I ² C-bus; 1.0 to 6 MHz; 0 to +70 °C	79
MAB8442P	microcontroller; 128 x 8 RAM; 4K x 8 ROM plus 8-bit LED driver; 15 I/O lines; I ² C-bus; 1.0 to 6 MHz; 0 to +70 °C	81
MAB8461P	microcontroller; 128 x 8 RAM; 6K x 8 ROM plus 8-bit LED driver; 20 I/O lines; I ² C-bus; 1.0 to 6 MHz; 0 to +70 °C	79
MAB8461T	microcontroller; 128 x 8 RAM; 6K x 8 ROM plus 8-bit LED driver; 20 I/O lines; I ² C-bus; 1.0 to 6 MHz; 0 to +70 °C	79

PCB83C654P	microcontroller; 256 x 8 RAM; 16K x 8 ROM; serial I/O; UART; I ² C-bus; 1.2 to 12 MHz; 0 to +70 °C	219
PCB83C654WP	microcontroller; 256 x 8 RAM; 16K x 8 ROM; serial I/O; UART; I ² C-bus; 1.2 to 12 MHz; 0 to +70 °C	219
PCB83C851P	microcontroller; 128 x 8 RAM; 4K x 8 ROM; 256 x 8 EEPROM; 1.2 to 12 MHz; 0 to +70 °C	221
PCB83C851WP	microcontroller; 128 x 8 RAM; 4K x 8 ROM; 256 x 8 EEPROM; 1.2 to 12 MHz; 0 to +70 °C	221
PCF1303T	18-element bar graph LCD driver (with analogue input)	223
PCF2100P	LCD duplex driver; 40 segments	229
PCF2100T	LCD duplex driver; 40 segments	229

NUMERICAL INDEX

type	description	page
PCF2110P	LCD duplex driver; 60 segments and 2 LEDs	229
PCF2110T	LCD duplex driver; 60 segments and 2 LEDs	229
PCF2111P	LCD duplex driver; 64 segments	229
PCF2111T	LCD duplex driver; 64 segments	229
PCF2112P	LCD driver; 32 segments	229
PCF2112T	LCD driver; 32 segments	229
PCF2201V	LCD flat panel row/column driver	245
PCF80C31BH-3P	microcontroller; 128 x 8 RAM; 1.2 to 12 MHz; -40 to + 85 °C	209
PCF80C31BH-3WP	microcontroller; 128 x 8 RAM; 1.2 to 12 MHz; -40 to + 85 °C	209
PCF80C39P	microcontroller; 128 x 8 RAM; 1.0 to 15 MHz; -40 to + 85 °C	211
PCF80C39WP	microcontroller; 128 x 8 RAM; 1.0 to 15 MHz; -40 to + 85 °C	211
PCF80C49P	microcontroller; 128 x 8 RAM; 2K x 8 ROM; 1.0 to 15 MHz; -40 to + 85 °C	211
PCF80C49WP	microcontroller; 128 x 8 RAM; 2K x 8 ROM; 1.0 to 15 MHz; -40 to + 85 °C	211
PCF80C51BH-3P	microcontroller; 128 x 8 RAM; 4K x 8 ROM; 1.2 to 12 MHz; -40 to + 85 °C	209
PCF80C51BH-3WP	microcontroller; 128 x 8 RAM; 4K x 8 ROM; 1.2 to 12 MHz; -40 to + 85 °C	209
PCF80C552WP	microcontroller; 256 x 8 RAM; 80C31 CPU plus 16-bit capture/compare timer/counter; watch-dog timer; 2 pulse-width modulated signals; 10-bit ADC with 8 multiplexed input lines; I ² C-bus; 1.2 to 12 MHz; -40 to + 85 °C	213
PCF80C562WP	microcontroller; 256 x 8 RAM; 80C31 CPU plus 16-bit capture/compare timer/counter; watch-dog timer; 2 pulse-width modulated signals; 8-bit ADC with 8 multiplexed input lines; 1.2 to 12 MHz; -40 to + 85 °C	215
PCF80C652P	microcontroller; 256 x 8 RAM; serial I/O; UART; I ² C-bus; 1.2 to 12 MHz; -40 to + 85 °C	217
PCF80C652WP	microcontroller; 256 x 8 RAM; serial I/O; UART; I ² C-bus; 1.2 to 12 MHz; -40 to + 85 °C	217
PCF80C851P	microcontroller; 128 x 8 RAM; 256 x 8 EEPROM; 1.2 to 12 MHz; -40 to + 85 °C	221
PCF80C851WP	microcontroller; 128 x 8 RAM; 256 x 8 EEPROM; 1.2 to 12 MHz; -40 to + 85 °C	221
PCF8200	voice synthesizer (CMOS); I ² C-bus	267
PCF83C552WP	microcontroller; 256 x 8 RAM; 8K x 8 ROM; 80C51 CPU plus 16-bit capture/compare timer/counter; watch-dog timer; 2 pulse-width modulated signals; 10-bit ADC with 8 multiplexed input lines; I ² C-bus; 1.2 to 12 MHz; -40 to + 85 °C	213
PCF83C562WP	microcontroller; 256 x 8 RAM; 8K x 8 ROM; 80C51 CPU plus 16-bit capture/compare timer/counter; watch-dog timer; 2 pulse-width modulated signals; 8 multiplexed input lines; 1.2 to 12 MHz; -40 to + 85 °C	215

type	description	page
PCF83C652P	microcontroller; 256 x 8 RAM; 8K x 8 ROM; serial I/O; UART; I ² C-bus; 1.2 to 12 MHz; -40 to +85 °C	217
PCF83C652WP	microcontroller; 256 x 8 RAM; 8K x 8 ROM; serial I/O; UART; I ² C-bus; 1.2 to 12 MHz; -40 to +85 °C	217
PCF83C654P	microcontroller; 256 x 8 RAM; 16K x 8 ROM; serial I/O; UART; I ² C-bus; 1.2 to 12 MHz; -40 to +85 °C	219
PCF83C654WP	microcontroller; 256 x 8 RAM; 16K x 8 ROM; serial I/O; UART; I ² C-bus; 1.2 to 12 MHz; -40 to +85 °C	219

PCF83C851WP	microcontroller; 128 x 8 RAM; 4K x 8 ROM; 256 x 8 EEPROM; 1.2 to 12 MHz; -40 to +85 °C	221
PCF84CXXX	single-chip 8-bit microcontroller family	281
PCF84C00B	microcontroller; 256 x 8 RAM; bond-out version PCF84CXX family; I ² C-bus	283
PCF84C00T	microcontroller; 256 x 8 RAM; bond-out version PCF84CXX family; I ² C-bus	283
PCF84C12P	low cost microcontroller; 64 x 8 RAM; 1K x 8 ROM	285
PCF84C12T	low cost microcontroller; 64 x 8 RAM; 1K x 8 ROM	285
PCF84C21P	microcontroller; 64 x 8 RAM; 2K x 8 ROM; plus 8-bit LED driver; I ² C-bus; -40 to +85 °C	283
PCF84C21T	microcontroller; 64 x 8 RAM; 2K x 8 ROM; plus 8-bit LED driver; I ² C-bus; -40 to +85 °C	283
PCF84C22P	low cost microcontroller; 64 x 8 RAM; 1K x 8 ROM	285
PCF84C22T	low cost microcontroller; 64 x 8 RAM; 1K x 8 ROM	285
PCF84C41P	microcontroller; 128 x 8 RAM; 4K x 8 ROM; plus 8-bit LED driver; I ² C-bus; -40 to +85 °C	283
PCF84C41T	microcontroller; 128 x 8 RAM; 4K x 8 ROM; plus 8-bit LED driver; I ² C-bus; -40 to +85 °C	283
PCF84C42P	low cost microcontroller; 64 x 8 RAM; 4K x 8 ROM	285
PCF84C42T	low cost microcontroller; 64 x 8 RAM; 4K x 8 ROM	285
PCF84C81P	microcontroller; 256 x 8 RAM; 8K x 8 ROM; plus 8-bit LED driver; I ² C-bus; -40 to +85 °C	283
PCF84C81T	microcontroller; 256 x 8 RAM; 8K x 8 ROM; plus 8-bit LED driver; I ² C-bus; -40 to +85 °C	283
PCF84C85P	microcontroller; 256 x 8 RAM; 8K x 8 ROM; 32 I/O; plus 8-bit LED driver; I ² C-bus; -40 to +85 °C	287
PCF84C85T	microcontroller; 256 x 8 RAM; 9K x 8 ROM; 32 I/O; plus 8-bit LED driver; I ² C-bus; -40 to +85 °C	287
PCF8566P	universal LCD driver for low multiplex rates (1:1 to 1:4); max. 96 elements; I ² C-bus	289
PCF8566T	universal LCD driver for low multiplex rates (1:1 to 1:4); max. 96 elements; I ² C-bus	289
PCF8570P	256 x 8-bit static RAM; I ² C-bus	319
PCF8570T	256 x 8-bit static RAM; I ² C-bus	319
PCF8570CP	256 x 8-bit static RAM; I ² C-bus; different slave address	319
PCF8570CT	256 x 8-bit static RAM; I ² C-bus; different slave address	319
PCF8571P	128 x 8-bit static RAM; I ² C-bus	319
PCF8571T	128 x 8-bit static RAM; I ² C-bus	319

NUMERICAL INDEX

type	description	page
PCF8573P	clock calendar, I ² C-bus	329
PCF8573T	clock calendar; I ² C-bus	329
PCF8574AP	remote 8-bit I/O expander; I ² C-bus; different slave address	347
PCF8574AT	remote 8-bit I/O expander; I ² C-bus; different slave address	347
PCF8574P	remote 8-bit I/O expander; I ² C-bus	347
PCF8574T	remote 8-bit I/O expander; I ² C-bus	347
PCF8576T	universal LCD driver for low multiplex rates (1:1 to 1:4); max. 160 segments; I ² C-bus	359
PCF8576U	universal LCD driver for low multiplex rates (1:1 to 1:4); max. 160 segments; I ² C-bus	359
PCF8576U/10	universal LCD driver for low multiplex rates (1:1 to 1:4); max. 160 segments; I ² C-bus	359
PCF8577AP	LCD direct driver (32 segments) or duplex driver (64 segments); I ² C-bus; different slave address	393
PCF8577AT	LCD direct driver (32 segments) or duplex driver (64 segments) I ² C-bus; different slave address	393
PCF8577AU	LCD direct driver (32 segments) or duplex driver (64 segments) I ² C-bus; different slave address	393
PCF8577P	LCD direct driver (32 segments) or duplex driver (64 segments); I ² C-bus	393
PCF8577T	LCD direct driver (32 segments) or duplex driver (64 segments); I ² C-bus	393
PCF8577U	LCD direct driver (32 segments) or duplex driver (64 segments); I ² C-bus	393
PCF8578T	LCD row/column driver for dot matrix graphic displays; 40 outputs; of which 24 are programmable; I ² C-bus	409
PCF8578U	LCD row/column driver for dot matrix graphic displays; 40 outputs, of which 24 are programmable; I ² C-bus	409
PCF8578V	LCD row/column driver for dot matrix graphic displays; 40 outputs, of which 24 are programmable; I ² C-bus	409
PCF8579T	LCD column driver for dot matrix graphic displays; 40 column outputs; I ² C-bus	447
PCF8579U	LCD column driver for dot matrix graphic displays; 40 column outputs; I ² C-bus	447
PCF8579V	LCD column driver for dot matrix graphic displays; 40 column outputs; I ² C-bus	447
PCF8582AP	256 x 8-bit EEPROM; I ² C-bus; -40 to +85 °C	481
PCF8582AT	256 x 8-bit EEPROM; I ² C-bus; -40 to +85 °C	481
PCF8583P	clock calendar with 256 x 8-bit static RAM; I ² C-bus	491
PCF8583T	clock calendar with 256 x 8-bit static RAM; I ² C-bus	491
PCF8591P	8-bit ADC/DAC; I ² C-bus	509
PCF8591T	8-bit ADC/DAC; I ² C-bus	509
PNA7509P	7-bit ADC; 22 MHz; 3-state output	527
PNA7518P	8-bit multiplying DAC; 30 MHz	539

type	description	page
SA571F	compandor	95
SA571N	compandor	95
SA572D	programmable analogue compandor	103
SA572F	programmable analogue compandor	103
SA572N	programmable analogue compandor	103
SA5534N	dual and single low noise operational amplifier	135
SA5534AD	dual and single low noise operational amplifier	135
SA5534AN	dual and single low noise operational amplifier	135
SA602D	double balanced mixer and oscillator	143
SA602N	double balanced mixer and oscillator	143
SA602FE	double balanced mixer and oscillator	143
SA604AD	high performance low-power FM IF system	149
SA604AN	high performance low-power FM IF system	149
SA605D	low-power FM IF system	159
SA605F	low-power FM IF system	159
SA605N	low-power FM IF system	159
SA614AD	low-power FM IF system	169
SA614 AN	low-power FM IF system	169
SAA1057	radio tuning PLL frequency synthesizer (SYMO II)	545
SAA1064P	4-digit LED driver; I ² C-bus	555
SAA1099	stereo sound generator for sound effects and music synthesis (μ C-controlled)	565
SAA1300	tuner switching circuit; I ² C-bus	581
SAA3004P	high performance transmitter (455 kHz) for infrared remote control; up to 448 commands	585
SAA3004T	high performance transmitter (455 kHz) for infrared remote control; up to 448 commands	585
SAA3006P	high performance transmitter (RC-5) for infrared remote control; up to 2048 commands	595
SAA3007P	high performance transmitter (455 kHz) for infrared remote control; up to 1280 commands; low voltage	609
SAA3007T	high performance transmitter (455 kHz) for infrared remote control; up to 1280 commands; low voltage	609
SAA3008P	high performance transmitter (38 kHz) for infrared remote control; low voltage	623
SAA3008T	high performance transmitter (38kHz) for infrared remote control; low voltage	623
SAA3009P	infrared remote control decoder; decodes 64 commands (RECS80/RC-5); up to 32 subaddresses; high current output capability for direct LED drive	637
SAA3010P	high performance transmitter (RC-5) for infrared remote control; low voltage	647
SAA3010T	high performance transmitter (RC-5) for infrared remote control; low voltage	647
SAA3028	high performance transcoder (RC-5) for infrared remote control; I ² C-bus	663
SAA3049P	infrared remote control decoder, low current version of SAA3009	637

NUMERICAL INDEX

type	description	page
SAA3049T	infrared remote control decoder, low current version of SAA3009	637
SAA7210	decoder for Compact Disc (second generation)	671
SAA7220	digital filter and interpolator for Compact Disc (second generation)	693
SAA7274P	audio digital input circuit (ADIC)	715
SAA7274T	audio digital input circuit (ADIC)	715
SAA7310P	decoder for Compact Disc (third generation)	727
SAA7310GP	decoder for Compact Disc (third generation)	727
SAA7320GP	stereo DAC for Compact Disc	757
SAD7630P	CCD delay line for error correction in video and sound carrier timebases (laservision players)	777
SAF1032P	receiver/decoder for infrared remote control	787
SAF1039P	transmitter for infrared remote control	787
SE5410F	10-bit high-speed multiplying DAC	119
SE5532FE	internally-compensated dual low noise operational amplifier	129
SE5532AFE	internally-compensated dual low noise operational amplifier	129
SE5534N	dual and single low noise operational amplifier	135
SE5534AN	dual and single low noise operational amplifier	135
SE5534FE	dual and single low noise operational amplifier	135
SE5534AFE	dual and single low noise operational amplifier	135
TDA1001B	interference and noise suppression circuit for FM receivers	801
TDA1001BT	interference and noise suppression circuit for FM receivers	801
TDA1010A	6 W audio power amplifier for in-car applications/10 W audio power amplifier for mains-fed applications	811
TDA1011	2 to 6 W audio power amplifier with preamplifier	829
TDA1013B	4 W audio power amplifier with DC volume control	841
TDA1015	1 to 4 W audio power amplifier with preamplifier	849
TDA1015T	0.5 W audio power amplifier with preamplifier	859
TDA1016	2 W recording/playback audio power amplifier with preamplifier, automatic level control, short circuit and thermal protection	865
TDA1020	12 W audio power amplifier with preamplifier for car radios	871
TDA1029	signal-sources switch (4 x two channels)	877
TDA1059B	motor speed regulator with thermal shut-down; multiplication coefficient = 9; drop-out voltage = 1.8 V	891
TDA1072A	AM receiver circuit for hi-fi and car radios	897
TDA1072AT	AM receiver circuit for hi-fi and car radios	913
TDA1074A	dual tandem electronic potentiometer circuit	931
TDA1510	24 W BTL or 2 x 12 W stereo car radio power amplifier	941
TDA1510A	24 W BTL or 2 x 12 W stereo car radio power amplifier	941
TDA1512	12 to 20 W hi-fi audio power amplifier	983
TDA1512Q	12 to 20 W hi-fi audio power amplifier	983
TDA1514A	50 W hi-fi power amplifier for digital audio (e.g. Compact Disc)	989
TDA1515B	24 W or 2 x 12 W stereo car radio power amplifier	997
TDA1516Q	22 W BTL or 2 x 11 W stereo car radio power amplifier; closed loop voltage gain 26 dB	1003
TDA1517	2 x 6 W stereo car radio audio power amplifier (20 dB gain)	1011

type	description	page
TDA1518Q	22 W BTL or 2 x 11 W stereo car radio power amplifier; closed loop voltage gain 46 dB	1019
TDA1519	2 x 6 W stereo car radio audio power amplifier (40 dB gain)	1027
TDA1519A	22 W BTL or 2 x 11 W stereo car radio power amplifier	1035
TDA1519B	12 W BTL or 2 x 6 W stereo car radio power amplifier	1045
TDA1520B	20 W hi-fi audio power amplifier; complete SOAR protection	1055
TDA1520BQ	20 W hi-fi audio power amplifier; complete SOAR protection	1055
TDA1521	2 x 12 W hi-fi stereo audio power amplifier	1061
TDA1521A	2 x 6 W hi-fi stereo audio power amplifier	1071
TDA1521Q	2 x 12 W hi-fi stereo audio power amplifier	1061
TDA1522	stereo playback amplifier/equalizer with mute switch	1081
TDA1524A	stereo tone/volume control circuit	1091
TDA1525	stereo tone/volume control circuit	1103
TDA1534	14-bit ADC	1117
TDA1535	high-speed sample-and-hold amplifier	1125
TDA1541A	dual 16-bit DAC	1129
TDA1542	active element for post filtering (dual channel)	1137
TDA1543	dual 16-bit economy DAC (I ² S-bus format)	1145
TDA1572	AM receiver circuit for stereo hi-fi and car radios	1153
TDA1572T	AM receiver circuit for stereo hi-fi and car radios	1171
TDA1574	integrated FM tuner for radio receivers	1187
TDA1574T	integrated FM tuner for radio receivers	1195
TDA1576	FM/IF amplifier and detector	1205
TDA1578A	time multiplex PLL stereo decoder for hi-fi and car radios	1217
TDA1579	traffic warning decoder circuit (AM carriers); ARI system	1231
TDA1579T	traffic warning decoder circuit (AM carriers); ARI system	1231
TDA1589	traffic control message and warning tone circuit; ARI system	1241
TDA1596	FM/IF amplifier and detector	1249
TDA1596T	FM/IF amplifier and detector	1267
TDA1598	time multiplex PLL stereo decoder for hi-fi and car radios	1285
TDA1600	multi-function oscillator switch for audio cassette recorders	1293
TDA2611A	5 W audio power amplifier	1305
TDA2613	6 W hi-fi audio power amplifier	1315
TDA3047P	high performance receiver for infrared remote control; positive output voltage	1323
TDA3047T	high performance receiver for infrared remote control; positive output voltage	1323
TDA3048P	high performance receiver for infrared remote control; negative output voltage	1329
TDA3048T	high performance receiver for infrared remote control; negative output voltage	1329
TDA3810	spatial, stereo and pseudo-stereo sound circuit	1335
TDA5040T	DC motor drive circuit with magnetic-field detector	1339
TDA5708	photo diode signal processor for Compact Disc single-spot read-out systems	1347
TDA5709	radial error signal processor for Compact Disc	1367
TDA7000	FM radio circuit; mono (in plastic DIL18)	1381
TDA7010T	FM radio circuit; mono (in SO16 plastic mini-pack)	1389
TDA7021T	FM radio circuit; stereo/mono; for low voltage micro tuning system (MTS)	1397

NUMERICAL INDEX

type	description	page
TDA7030T	low voltage micro tuning system (MTS)	1407
TDA7040T	PLL stereo decoder; low voltage	1415
TDA7050	150 mW BTL or 2 x 75 mW stereo audio power amplifier; low voltage	1423
TDA7050T	150 mW BTL or 2 x 75 mW stereo audio power amplifier; low voltage	1427
TDA7052	1 W BTL mono audio amplifier for portable applications	1431
TDA7053	2 x 1 W BTL stereo audio power amplifier for portable applications	1437
TDA8420	hi-fi stereo audio processor; I ² C-bus	1445
TDA8421	hi-fi stereo audio processor; I ² C-bus	1467
TDA8425	hi-fi stereo audio processor; I ² C-bus	1489
TDA8444	octuple 6-bit DAC; I ² C-bus	1511
TDA8808AT	photo diode signal processor for Compact Disc	1519
TDA8808T	photo diode signal processor for Compact Disc	1519
TDA8808	transfer functions	1539
TDA8809T	radial error signal processor for Compact Disc	1559
TDA8809	transfer functions	1571
TDB1080	IF limiting amplifier, FM detector and audio amplifier	1583
TDB1080T	IF limiting amplifier, FM detector and audio amplifier	1583
TDD1601	equalizer for audio cassette recorders	1589
TDD1742T	low power frequency synthesizer (LOPSY)	1605
TEA0651	Dolby B & C noise reduction circuit	1627
TEA0652	Dolby B & C noise reduction circuit	1627
TEA0653T	stereo or 2-channel Dolby B noise reduction circuit	1645
TEA0654	preamplifier and electronic switch for Dolby B & C noise reduction circuits	1627
TEA0657	dual Dolby B noise reduction circuit	1651
TEA0665	Dolby B & C processor with preamplifier and electronic switch	1659
TEA0665T	Dolby B & C processor with preamplifier and electronic switch	1659
TEA0666	Dolby B & C processor with preamplifier and electronic switch; changed frequency response in relation to TEA0665	1669
TEA0666T	Dolby B & C processor with preamplifier and electronic switch; changed frequency response in relation to TEA0665	1669
TEA0670T	Dolby B & C processor with preamplifier and electronic switch; low voltage	1679
TEA5551T	single-chip AM radio circuit, plus dual AF amplifier, for pocket receivers with headphones	1685
TEA5570	AM/FM radio receiver circuit	1697
TEA5580	PLL stereo decoder for medium-fi and car radios	1711
TEA5581	PLL stereo decoder with source selector switch for medium-fi and car radios	1721
TEA5581T	PLL stereo decoder with source selector switch for medium-fi and car radios	1721
TEA5591	AM/FM radio receiver circuit	1733

NUMERICAL INDEX

type	description	page
TEA6100	FM/IF system and microcomputer-based tuning interface; I ² C-bus	1751
TEA6200	AM upconversion radio receiver; 10.7 MHz IF	1775
TEA6300	car radio preamplifier and source selector with sound and fader controls; I ² C-bus	1787
TEA6300T	car radio preamplifier and source selector with sound and fader controls; I ² C-bus	1787
TEA6310T	sound fader control circuit; I ² C-bus	1803
TSA6057	radio tuning PLL frequency synthesizer; I ² C-bus	1821
TSA6057T	radio tuning PLL frequency synthesizer; I ² C-bus	1821
μA758N	FM stereo multiplex decoder; PLL	1831

MAINTENANCE TYPE LIST

The types listed below are not included in this handbook. Detailed information will be supplied on request.

SAA1056P	PLL frequency synthesizer	successor type: SAA1057
SAA3027	infrared remote control transmitter (RC-5)	successor type: SAA3006
TCA730A	DC volume and balance stereo control circuit	
TCA740A	DC treble and bass stereo control circuit	
TDA1011A	2 to 6 W audio power amplifier	successor type: TDA1011
TDA1506	motor regulator and function controller for car cassette systems	
TDA1508	auto-reverse car radio cassette deck steering circuit	
TDA1533	PLL motor speed control circuit for hi-fi applications	
TDA7020T	low voltage FM stereo radio circuit	successor type: TDA7021T

DEVICE DATA

12 to 20 W HI-FI AUDIO POWER AMPLIFIER

The TDA1512 is a monolithic integrated hi-fi audio power amplifier designed for asymmetrical power supplies for mains-fed apparatus.

Special features are:

- Thermal protection
- Low intermodulation distortion
- Low transient intermodulation distortion
- Built-in output current limiter
- Low input offset voltage
- Output stage with low cross-over distortion
- Single in-line (SIL) power package

QUICK REFERENCE DATA

Supply voltage range	V_P	15 to 35 V
Total quiescent current at $V_P = 25$ V	I_{tot}	typ. 65 mA

TDA1514A

50 W HIGH- PERFORMANCE HI-FI AMPLIFIER

GENERAL DESCRIPTION

The TDA1514A integrated circuit is a hi-fi power amplifier for use as a building block in radio, tv and other audio applications. The high performance of the IC meets the requirements of digital sources (e.g. Compact Disc equipment).

The circuit is totally protected, the two output transistors both having thermal and SOAR protection (see Fig.3). The circuit also has a mute function that can be arranged for a period after power-on with a delay time fixed by external components.

The device is intended for symmetrical power supplies but an asymmetrical supply may also be used.

Features

- High output power (also without bootstrap)
- Low offset voltage
- Good ripple rejection
- Mute/stand-by facilities
- Thermal protection
- Protected against electrostatic discharge
- No switch-on or switch-off clicks
- Very low thermal resistance
- Safe Operating Area (SOAR) protection
- Short-circuit protection

Short circuit protection time*	t_{sc}	—	10	min
Mute voltage (pin 3 to pin 4)	V_m	—	7	V

THERMAL RESISTANCE

From junction to mounting base

$$R_{th\ j-mb} \text{ max.} = 1 \text{ K/W}$$

DEVELOPMENT DATA

* Symmetrical power supply: AC and DC short-circuit protected.
 Asymmetrical power supply: AC short-circuit protected.
 Driven by a pink-noise voltage.

Fig.2 Power derating curve.

The theoretical maximum power dissipation for $P_O = 40$ W with a stabilized power supply is:

$$\frac{V_P^2}{2\pi^2 R_L} = 19 \text{ W; where } V_P = \pm 27.5 \text{ V; } R_L = 8 \Omega$$

Considering, for example, a maximum ambient temperature of 50°C and a maximum junction temperature of 150°C the total thermal resistance is:

$$R_{th j-a} = \frac{150 - 50}{19} = 5.3 \text{ K/W}$$

Since the thermal resistance of the SOT131A encapsulation is $R_{th j-mb} < 1 \text{ K/W}$, the thermal resistance required of the heatsink is $R_{th h-a} < 4.3 \text{ K/W}$.

SAFE OPERATING AREA (SOAR) PROTECTION

Fig.3 SOAR protection curve.

CHARACTERISTICS

$V_p = \pm 27.5 \text{ V}$; $R_L = 8 \Omega$; $f = 1 \text{ kHz}$; $T_{amb} = 25 \text{ }^\circ\text{C}$; test circuit as Fig.4; unless otherwise specified.

Ripple rejection		RR	—	70	—	dB
Supply voltage to obtain standby state		$\pm V_p$	4.5	—	7.0	V

Notes to the characteristics

1. Measured with two superimposed signals of 50 Hz and 7 kHz with an amplitude relationship of 4 : 1.
2. The closed loop gain is determined by external resistors (Fig.4, R2 and R3) and is variable between 20 and 46 dB.
3. The input impedance in the test circuit (Fig.4) is determined by the bias resistor R1.
4. The noise output voltage is measured in a bandwidth of 20 Hz to 20 kHz with a source resistance of 2 k Ω .
5. The quiescent current into pin 2 has an impact on the mute time.

* Value to be fixed.

DEVELOPMENT DATA

- (1) Mounting base connected to $-V_p$.
- (2) When used without a bootstrap these components are disconnected and pin 6 is connected to pin 7 thus decreasing the output power by approximately 4 W.

Fig.4 Application and test circuit.

24 W BTL OR 2 x 12 W STEREO CAR RADIO POWER AMPLIFIER

The TDA1515A is a monolithic integrated class-B output amplifier in a 13-lead single in-line (SIL) plastic power package. The device is primarily developed for car radio applications, and also to drive low-impedance loads (down to $1,6 \Omega$). At a supply voltage $V_p = 14,4 \text{ V}$, an output power of 24 W can be delivered into a 4Ω BTL (Bridge Tied Load), or, when used as stereo amplifier, it delivers $2 \times 12 \text{ W}$ into 2Ω or $2 \times 7 \text{ W}$ into 4Ω .

Special features are:

- flexibility in use — mono BTL as well as stereo
- high output power
- low offset voltage at the output (important for BTL)
- large usable gain variation
- very good ripple rejection
- internal limited bandwidth for high frequencies
- low stand-by current possibility (typ. $1 \mu\text{A}$), to simplify required switches; TTL drive possible
- low number and small sized external components
- high reliability

The following currently required protections are incorporated in the circuit. These protections also have positive influence on reliability in the applications.

- load dump protection
- a.c. and d.c. short-circuit safe to ground up to $V_p = 18 \text{ V}$
- thermal protection
- speaker protection in bridge configuration
- SOAR protection
- outputs short-circuit safe to ground in BTL
- reverse polarity safe

QUICK REFERENCE DATA

HEATSINK DESIGN EXAMPLE

The derating of 3 K/W of the encapsulation requires the following external heatsink (for sine-wave drive):

24 W BTL (4 Ω) or 2 x 12 W stereo (2 Ω)

maximum sine-wave dissipation: 12 W

$T_{amb} = 65$ °C maximum

$$R_{th\ h-a} = \frac{150-65}{12} - 3 = 4 \text{ K/W.}$$

2 x 7 W stereo (4 Ω)

maximum sine-wave dissipation: 6 W

$T_{amb} = 65$ °C maximum

$$R_{th\ h-a} = \frac{150-65}{6} - 3 = 11 \text{ K/W.}$$

D.C. CHARACTERISTICS

Supply voltage range (pin 10)	V_P		6 to 18 V

Notes

1. The internal circuit impedance at pin 11 is $> 5 \text{ k}\Omega$ if $V_{11} > V_{10}$.
2. Closed loop voltage gain can be chosen between 32 and 56 dB (BTL), and is determined by external components. For further gain reduction see Application Report.
3. Frequency response externally fixed.
4. The input impedance in the test circuit (Fig. 3) is typ. $100 \text{ k}\Omega$.
5. Supply voltage ripple rejection measured with a source impedance of 0Ω (maximum ripple amplitude: 2 V).
6. Output power is measured directly at the output pins of the IC.
7. Closed loop voltage gain can be chosen between 26 and 50 dB (stereo), and is determined by external components.
8. A resistor of $56 \text{ k}\Omega$ between pins 3 and 7 to reach symmetrical clipping.
9. Without bootstrap the $100 \mu\text{F}$ capacitor between pins 5 and 6 (8 and 9) can be omitted. Pins 6, 8 and 10 have to be interconnected.

Fig. 3 Test/application circuit bridge tied load (BTL).

Fig. 4 Test/application circuit stereo.

1. Belongs to power supply.

DEVELOPMENT DATA

This data sheet contains advance information and specifications are subject to change without notice.

TDA1516Q

22 W BTL OR 2 × 11 WATT STEREO CAR RADIO POWER AMPLIFIER

GENERAL DESCRIPTION

The TDA1516Q is an integrated class-B output amplifier in a 13-lead single-in-line (SIL) plastic power package. The device is primarily developed for car radio applications.

FEATURES

- Requires very few external components
- Flexibility in use — stereo as well as mono BTL
- High output power (without bootstrap)
- Low offset voltage at output (important for BTL)
- Fixed gain
- Good ripple rejection
- Mute/stand-by switch
- Load dump protection
- A.C. and d.c. short-circuit-safe to ground and V_p
- Thermally protected
- Reverse polarity safe
- Capability to handle high energy on outputs ($V_p = 0$ V)
- No switch-on/switch-off pop
- Flexible leads
- Low thermal resistance
- Identical inputs (inverting and non-inverting)
- Compatible with TDA1518Q (except gain)

FUNCTIONAL DESCRIPTION

The TDA1516Q contains two identical amplifiers with differential input stages. This device can be used for stereo or bridge applications. The gain of each amplifier is fixed at 20 dB. A special feature of this device is the mute/stand-by switch which has the following features:

- low stand-by current ($< 100 \mu\text{A}$)
- low mute/stand-by switching current (low cost supply switch)
- mute condition

Notes to the characteristics

1. All characteristics, for stereo application are measured using the circuit shown in Fig. 3.
2. The circuit is d.c. adjusted at V_p = 6 V to 18 V and a.c. operating at V_p = 8,5 to 18 V.
3. At 18 V < V_p < 30 V the d.c. output voltage $\leq V_p/2$.
4. Output power is measured directly at the output pins of the IC.
5. With bootstrap and a 100 k Ω resistor from pin 12 to the positive supply voltage (V_p), value of bootstrap capacitor is 47 μF .
6. Frequency response externally fixed.
7. Ripple rejection measured at the output with a source impedance of 0 Ω (maximum ripple amplitude of 2 V) and a frequency between 1 kHz and 10 kHz.
8. Noise voltage measured in a bandwidth of 20 Hz to 20 kHz.
9. Noise output voltage independent of R_S (V_I = 0 V).
10. All characteristics, for BTL application are measured using the circuit shown in Fig. 4.

TDA1517

2 × 6 WATT STEREO CAR RADIO POWER AMPLIFIER

GENERAL DESCRIPTION

The TDA1517 is an integrated class-B dual output amplifier in a 9-lead single-in-line (SIL) plastic medium power package. The device is primarily developed for car radio applications.

Features

- Requires very few external components
- High output power
- Fixed gain
- Good ripple rejection
- Mute/stand-by switch
- Load dump protection
- AC and DC short-circuit-safe to ground and V_p
- Thermally protected
- Reverse polarity safe
- Capability to handle high energy on outputs ($V_p = 0$ V)
- No switch-on/switch-off plop
- Protected against electrostatic discharge
- Compatible with TDA1519 (except gain)

TDA1518Q

22 W BTL OR 2 × 11 WATT STEREO CAR RADIO POWER AMPLIFIER

GENERAL DESCRIPTION

The TDA1518Q is an integrated class-B output amplifier in a 13-lead single-in-line (SIL) plastic power package. The device is primarily developed for car radio applications.

FEATURES

- Requires very few external components
- Flexibility in use — stereo as well as mono BTL
- High output power (without bootstrap)
- Low offset voltage at output (important for BTL)
- Fixed gain
- Good ripple rejection
- Mute/stand-by switch
- Load dump protection
- A.C. and d.c. short-circuit-safe to ground and V_p
- Thermally protected
- Reverse polarity safe
- Capability to handle high energy on outputs ($V_p = 0$ V)
- No switch-on/switch-off plop
- Flexible leads
- Low thermal resistance
- Identical inputs (inverting and non-inverting)
- Compatible with TDA1516Q (except gain)

TDA1519

2 × 6 WATT STEREO CAR RADIO POWER AMPLIFIER

GENERAL DESCRIPTION

The TDA1519 is an integrated class-B dual output amplifier in a 9-lead single in-line (SIL) plastic medium power package. The device is primarily developed for car radio applications.

Features

- Requires very few external components
- High output power
- Fixed gain
- Good ripple rejection
- Mute/stand-by switch
- Load dump protection
- AC and DC short-circuit-safe to ground and V_p
- Thermally protected
- Reverse polarity safe
- Capability to handle high energy on outputs ($V_p = 0\text{ V}$)
- No switch-on/switch-off pop
- Protected against electrostatic discharge
- Compatible with TDA1517 (except gain)

FUNCTIONAL DESCRIPTION

The TDA1519 contains two identical amplifiers with differential input stages. The gain of each amplifier is fixed at 40 dB. A special feature of this device is the mute/stand-by switch which has the following features:

- low stand-by current ($< 100 \mu\text{A}$)
- low mute/stand-by switching current (low cost supply switch)
- mute condition

DEVELOPMENT DATA

Notes to the characteristics

1. All characteristics are measured using the circuit shown in Fig. 4.
2. The circuit is DC adjusted at $V_P = 6\text{ V}$ to 18 V and AC operating at $V_P = 8,5\text{ V}$ to 18 V .
3. At $18\text{ V} < V_P < 30\text{ V}$ the DC output voltage $\leq V_P/2$.
4. Output power is measured directly at the output pins of the IC.
5. Frequency response externally fixed.
6. Ripple rejection measured at the output with a source impedance of $0\ \Omega$ (maximum ripple amplitude of 2 V) and a frequency between 100 Hz and 10 kHz .
7. Noise voltage measured in a bandwidth of 20 Hz to 20 kHz .
8. Noise output voltage independent of R_S ($V_I = 0\text{ V}$).

22 W BTL OR 2 × 11 WATT STEREO CAR RADIO POWER AMPLIFIER

GENERAL DESCRIPTION

The TDA1519A is an integrated class-B dual output amplifier in a 9-lead single in-line (SIL) plastic power package. The device is primarily developed for car radio applications.

Features

- Requires very few external components for Bridge Tied Load (BTL)
- Stereo or BTL application
- High output power
- Low offset voltage at output (important for BTL)
- Fixed gain
- Good ripple rejection
- Mute/stand-by switch
- Load dump protection
- AC and DC short-circuit-safe to ground and V_p
- Thermally protected
- Reverse polarity safe
- Capability to handle high energy on outputs ($V_p = 0$ V)
- No switch-on/switch-off pop
- Protected against electrostatic discharge
- Low thermal resistance
- Identical inputs (inverting and non-inverting)
- Compatible with TDA1519B (except output power)

TDA1519B

12 W BTL OR 2 × 6 WATT STEREO CAR RADIO POWER AMPLIFIER

GENERAL DESCRIPTION

The TDA1519B is an integrated class-B dual output amplifier in a 9-lead single in-line (SIL) plastic medium power package. The device is primarily developed for car radio applications.

Features

- Requires very few external components for Bridge Tied Load (BTL)
- Stereo or BTL application
- High output power
- Low offset voltage at output (important for BTL)
- Fixed gain
- Good ripple rejection
- Mute/stand-by switch
- Load dump protection
- AC and DC short-circuit-safe to ground and V_p
- Thermally protected
- Reverse polarity safe
- Capability to handle high energy on outputs ($V_p = 0$ V)
- No switch-on/switch-off pop
- Protected against electrostatic discharge
- Identical inputs (inverting and non-inverting)
- Compatible with TDA1519A (except output power)

Notes to the characteristics

1. The circuit is DC adjusted at $V_p = 6\text{ V}$ to 18 V and AC operating at $V_p = 8.5\text{ V}$ to 18 V .
2. At $18\text{ V} < V_p < 30\text{ V}$ the DC output voltage $\leq V_p/2$.
3. Output power is measured directly at the output pins of the IC.
4. Frequency response externally fixed.
5. Ripple rejection measured at the output with a source impedance of $0\ \Omega$ (maximum ripple amplitude of 2 V).
6. Frequency $f = 100\text{ Hz}$.
7. Frequency between 1 kHz and 10 kHz .
8. Noise voltage measured in a bandwidth of 20 Hz to 20 kHz .
9. Noise output voltage independent of R_S ($V_I = 0\text{ V}$).

DEVELOPMENT DATA

This data sheet contains advance information and specifications are subject to change without notice.

TDA1520B
TDA1520BQ

20 W HI-FI AUDIO POWER AMPLIFIER

GENERAL DESCRIPTION

The TDA1520B is an integrated hi-fi audio power amplifier designed for use with non-stabilized symmetrical or stabilized asymmetrical power supplies in mains-fed applications (e.g. stereo radio, stereo TV sound and cassette recorder).

Features

- Low offset voltage at output (suitable for BTL application)
- Low cross-over and secondary cross-over distortion
- Low intermodulation and transient intermodulation distortion
- Low harmonic distortion
- Good hum suppression
- High slew rate
- No switch-on/switch-off plop
- Thermal protection

DEVELOPMENT DATA

Notes to the Ratings

1. Minimum rise time of the supply must be ≥ 20 ms.
2. Maximum peak current is defined by the internal protection circuits.

POWER DISSIPATION AND HEATSINK INFORMATION

The maximum theoretical power dissipation with a stabilized power supply is ($V_P = 33$ V and $R_L = 4 \Omega$):

$$\frac{V_P^2}{2 \pi^2 R_L} = 13.8 \text{ W.}$$

Worst case power dissipation with a non-stabilized power supply is (regulation factor of 15%; over voltage of 10% and $R_L \text{ min.} = 0.8 \times R_L \text{ typ.}$; V_{PL} is the loaded supply voltage):

$$\frac{(1.1 \times V_{PL})^2}{2 \pi^2 R_L \text{ min.}} = 23.4 \text{ W.}$$

With a maximum ambient temperature of 50 °C and a maximum crystal temperature of 150 °C, the required thermal resistance is:

$$R_{th j-a} = \frac{150 - 50}{23.4} = 4.3 \text{ K/W.}$$

The thermal resistance of the encapsulation is ≤ 2.5 K/W, therefore the thermal resistance of the heatsink must be < 1.8 K/W.

Notes to the Characteristics

1. Output power is measured directly at the output pin.
2. The closed-loop gain is determined by external resistors and is variable between 20 to 40 dB.
3. Input impedance in the test circuit is determined by the bias resistor R.
4. Unweighted noise measured in a bandwidth of 20 Hz to 20 kHz at $R_S = 2\text{ k}\Omega$.
5. The transient intermodulation distortion is measured at $P_O = 10\text{ W}$. The input signal is a 3.18 kHz square-wave signal mixed with a 15 kHz sine-wave signal and a peak-to-peak voltage ratio of 4:1.

3	GND	{ ground (symmetrical) 1/2 VP (asymmetrical)	7	+VP	positive supply
4	OUT1	output 1	8	INV2	inverting input 2
			9	-INV2	non-inverting input 2

FUNCTIONAL DESCRIPTION

This hi-fi stereo power amplifier is designed for mains fed applications. The circuit is designed for both symmetrical and asymmetrical power supply systems. An output power of 2 x 12 watts (THD = 0,5%) can be delivered into an 8 Ω load with a symmetrical power supply of ± 16 V.

The gain is fixed internally at 30 dB. Internal gain fixing gives low gain spread and very good balance between the amplifiers (0,2 dB).

A special feature of this device is a mute circuit which suppresses unwanted input signals during switching on and off. Referring to Fig. 13, the 100 μ F capacitor creates a time delay when the voltage at pin 3 is lower than an internally fixed reference voltage. During the delay the amplifiers remain in their DC operating mode but are isolated from the non-inverting inputs on pins 1 and 9.

Two thermal protection circuits are provided, one monitors the average junction temperature and the other the instantaneous temperature of the power transistors. Both protection circuits activate at 150 $^{\circ}$ C allowing safe operation to a maximum junction temperature of 150 $^{\circ}$ C without added distortion.

RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

parameter	conditions	symbol	min.	max.	unit
Supply voltage	pin 7	$V_P = V_{7-3}$	—	+ 20	V
	pin 5	$-V_P = V_{5-3}$	—	-20	V
Non-repetitive peak output current	pins 4 and 6	I_{OSM}	—	4	A
Total power dissipation	see Fig. 2	P_{tot}			
Storage temperature range		T_{stg}	-65	+ 150	$^{\circ}$ C
Junction temperature		T_j	—	150	$^{\circ}$ C
Short-circuit time: outputs short-circuited to ground (full signal drive)	see note				
	symmetrical power supply	t_{sc}	—	1	hour
	asymmetrical power supply; $V_P < 32$ V (unloaded); $R_i \geq 4 \Omega$	t_{sc}	—	1	hour

Note

For asymmetrical power supplies (at short circuiting of the load) the maximum supply voltage is limited to $V_P = 28$ V. If the total internal resistance of the supply (R_i) $> 4 \Omega$, the maximum unloaded supply voltage is increased to 32 V.

Fig. 2 Power derating curve.

THERMAL RESISTANCE

From junction to case

$$R_{th\ j-c} = 2,5\ K/W$$

HEATSINK DESIGN EXAMPLE

With derating of 2,5 K/W, the value of heatsink thermal resistance is calculated as follows:

given $R_L = 8\ \Omega$ and $V_P = \pm 16\ V$, the measured maximum dissipation is 14,6 W; then, for a maximum ambient temperature of 65 °C, the required thermal resistance of the heatsink is

$$R_{th\ h-a} = \frac{150 - 65}{14,6} - 2,5 = 3,3\ K/W$$

Note: The internal metal block (heatsink) has the same potential as pin 5 ($-V_P$)

ripple voltage = 200 mV (r.m.s. value) applied to positive or negative supply rail.

APPLICATION INFORMATION

Input mute circuit

The input mute circuit operates only during switching on and off of the supply voltage. The circuit compares the $\frac{1}{2}$ supply voltage (at pin 3) with an internally fixed reference voltage (V_{ref}), derived directly from the supply voltage. When the voltage at pin 3 is lower than V_{ref} the non-inverting inputs (pins 1 and 9) are disconnected from the amplifier. The voltage at pin 3 is determined by an internal voltage divider and the external $100\ \mu\text{F}$ capacitor.

During switching on, a time delay is created between the reference voltage and the voltage at pin 3, during which the input terminal is disconnected, (as illustrated in Fig. 3).

			9	-INV2	non-inverting input 2

FUNCTIONAL DESCRIPTION

This hi-fi stereo power amplifier is designed for mains fed applications. The circuit is designed for both symmetrical and asymmetrical power supply systems. An output power of 2 x 6 watts (THD = 0,5%) can be delivered into an 8 Ω load with a symmetrical power supply of ± 12 V.

The gain is fixed internally at 30 dB. Internal gain fixing gives low gain spread and very good balance between the amplifiers (0,2 dB).

A special feature of this device is a mute circuit which suppresses unwanted input signals during switching on and off. Referring to Fig. 12, the 100 μ F capacitor creates a time delay when the voltage at pin 3 is lower than an internally fixed reference voltage. During the delay the amplifiers remain in their DC operating mode but are isolated from the non-inverting inputs on pins 1 and 9.

Two thermal protection circuits are provided, one monitors the average junction temperature and the other the instantaneous temperature of the power transistors. Both protection circuits activate at 150 $^{\circ}$ C allowing safe operation to a maximum junction temperature of 150 $^{\circ}$ C without added distortion.

THERMAL RESISTANCE

From junction to case

$$R_{th\ j-c} = 6\text{ K/W}$$

HEATSINK DESIGN EXAMPLE

With derating of 6 K/W, the value of heatsink thermal resistance is calculated as follows:

given $R_L = 8\ \Omega$ and $V_p = \pm 12\text{ V}$, the measured maximum dissipation is 7,8 W; then, for a maximum ambient temperature of 60 °C, the required thermal resistance of the heatsink is

$$R_{th\ h-a} = \frac{150 - 60}{7,8} - 6 = 5,5\text{ K/W}$$

Note: The metal tab (heatsink) has the same potential as pin 5 (- V_p).

Notes to the characteristics

1. Power bandwidth at $P_O \text{ max} -3\text{ dB}$.
2. Ripple rejection at $R_S = 0\ \Omega$, $f = 100\text{ Hz}$ to 20 kHz ;
 ripple voltage = 200 mV (r.m.s. value) applied to positive or negative supply rail.

APPLICATION INFORMATION

Input mute circuit

The input mute circuit operates only during switching on and off of the supply voltage. The circuit compares the $\frac{1}{2}$ supply voltage (at pin 3) with an internally fixed reference voltage (V_{ref}), derived directly from the supply voltage. When the voltage at pin 3 is lower than V_{ref} the non-inverting inputs (pins 1 and 9) are disconnected from the amplifier. The voltage at pin 3 is determined by an internal voltage divider and the external $100\ \mu\text{F}$ capacitor.

During switching on, a time delay is created between the reference voltage and the voltage at pin 3, during which the input terminal is disconnected, (as illustrated in Fig. 3).

Fig. 3 Input mute circuit; time delay.

STEREO CASSETTE HEAD PREAMPLIFIER AND EQUALIZER

GENERAL DESCRIPTION

The TDA1522 is a playback amplifier for car radio/cassette players.

Features

- Two independent amplifiers with open loop gain of typ. 90 dB
- Internal d.c. feedback via a 140 k Ω resistor from output to feedback point
- A.C. characteristics that can be determined externally by an RC network
- Electronic on/off switching with transient suppression for switch on
- Head input at d.c. ground that eliminates the input coupling capacitor
- Minimal external component requirement
- Stability down to a gain of 30 dB
- Low input noise
- Low distortion
- D.C. input current < 2 μ A
- Wide supply voltage range

QUICK REFERENCE DATA

Supply voltage range (pin 8)	V _P	7,5 to 23 V
Supply current (pin 8)	I _P	typ. 5 mA
Operating ambient temperature range	T _{amb}	-30 to +85 °C
Total harmonic distortion	THD	typ. 0,05 %
Channel separation at R _S = 10 k Ω ; L _S = 0	α	min. 45 dB

PACKAGE OUTLINE

9-lead SIL; plastic (SOT142).

STEREO-TONE/VOLUME CONTROL CIRCUIT

GENERAL DESCRIPTION

The device is designed as an active stereo-tone/volume control for car radios, TV receivers and mains-fed equipment. It includes functions for bass and treble control, volume control with built-in contour (can be switched off) and balance. All these functions can be controlled by d.c. voltages or by single linear potentiometers.

Features

- Few external components necessary
- Low noise due to internal gain
- Bass emphasis can be increased by a double-pole low-pass filter
- Wide power supply voltage range

QUICK REFERENCE DATA

Supply voltage (pin 3)	$V_P = V_{3-18}$	typ.	12 V
Supply current (pin 3)	$I_P = I_3$	typ.	35 mA
Maximum input signal with d.c. feedback (r.m.s. value)	$V_i(\text{rms})$	typ.	2,5 V
Maximum output signal with d.c. feedback (r.m.s. value)	$V_o(\text{rms})$	typ.	3 V
Volume control range	G_V		-80 to + 21,5 dB
Bass control range at 40 Hz	ΔG_V		-19 to + 17 dB
Treble control range at 16 kHz	ΔG_V	typ.	± 15 dB
Total harmonic distortion	THD	typ.	0,3 %
Output noise voltage (unweighted; r.m.s. value) at $f = 20$ Hz to 20 kHz; $V_P = 12$ V; for max. voltage gain for voltage gain $G_V = -40$ dB	$V_{no}(\text{rms})$ $V_{no}(\text{rms})$	typ. typ.	310 μV 100 μV
Channel separation at $G_V = -20$ to + 21,5 dB	α_{cs}	typ.	60 dB
Tracking between channels at $G_V = -20$ to + 26 dB	ΔG_V	max.	2,5 dB
Ripple rejection at 100 Hz	RR	typ.	50 dB
Supply voltage range (pin 3)	$V_P = V_{3-18}$		7,5 to 16,5 V
Operating ambient temperature range	T_{amb}		-30 to + 80 $^{\circ}\text{C}$

PACKAGE OUTLINE

18-lead DIL; plastic (SOT102).

Notes to characteristics

- Equation for input resistance (see also Fig. 4)

$$R_i = \frac{160\text{ k}\Omega}{1 + G_V}; G_V \text{ max} = 12.$$

- Frequencies below 200 Hz and above 5 kHz have reduced voltage swing, the reduction at 40 Hz and at 16 kHz is 30%.
- In the event of bass boosting the output signal handling is reduced. The reduction is 1 dB for maximum bass boost.
- Linear frequency response.
- For peak values add $4,5\text{ dB}$ to r.m.s. values.

TDA1525

STEREO TONE/VOLUME CONTROL CIRCUIT

GENERAL DESCRIPTION

The TDA1525 is an active stereo tone/volume control for car radios, television receivers and mains-fed audio equipment. It includes functions for bass and treble control, volume control with built-in contour (can be switched off) and balance. All these functions can be controlled by DC voltages or by single linear potentiometers.

Features

- Few external components necessary
- Low noise due to internal gain
- Bass emphasis can be increased by a double-pole low-pass filter
- Wide power supply voltage range

Notes to the characteristics

1. Equation for input resistance (see also Fig. 3)

$$R_i = \frac{160\text{ k}\Omega}{1 + G_V}; G_{V\text{ max}} = 12.$$

2. Frequencies below 200 Hz and above 5 kHz have reduced voltage swing, the reduction at 40 Hz and at 16 kHz is 30%.
3. In the event of bass boosting the output signal handling is reduced. The reduction is 1 dB for maximum bass boost.
4. Linear frequency response.
5. For peak values add 4.5 dB to RMS values.

TDA1534

14-BIT ANALOGUE TO DIGITAL CONVERTER (ADC)

An integrated 14-bit analogue to digital converter (ADC) which uses the successive approximation conversion technique and includes the comparator, reference source and clock on the same chip. The high linearity makes it very suitable for signal processing while the accurate, temperature-compensated reference source makes it applicable for instrumentation purposes. The ADC accepts unipolar or bipolar input signals. Digital output data is in serial form. All digital outputs are fully TTL compatible.

QUICK REFERENCE DATA

Positive supply voltage (pin 5)	V_P	typ.	5 V
Negative supply voltage 1 (pin 6)	$-V_{N1}$	typ.	5 V
Negative supply voltage 2 (pin 9)	$-V_{N2}$	typ.	17 V
Signal-to-noise ratio	S/N	typ.	84 dB
Linearity error		typ.	$\pm \frac{1}{2}$ LSB
Total power dissipation	P_{tot}	typ.	500 mW
Operating ambient temperature range	T_{amb}	-20 to +70	°C
Storage temperature range	T_{stg}	-55 to +150	°C
Resolution			14 bits
Full scale input current	I_{FS}	typ.	4 mA

PACKAGE OUTLINE

28-lead dual in-line; plastic (with internal heat spreader) (SOT117).

14		28	digital ground

FUNCTIONAL DESCRIPTION

The circuit consists of the following parts:

14-bit D/A converter

Using "dynamic element matching", which results in high accuracy, linearity and longterm stability, without the need of trimming. The main parts of the DAC are the binary weighted current sources and the bit switches. The DAC also delivers an offset binary current for bipolar operation of the ADC.

Fast settling comparator/subtractor

Consisting of a high speed, clamped operational amplifier with special frequency compensation system.

Successive approximation register (SAR)

This register is an array of fourteen addressable latches, with the outputs connected to the bit switches of the D/A converter.

Logic-level converters

Converting the internally used current-mode-logic (CML) levels to TTL levels, for easy interface of the ADC with standard logic families.

Clock oscillator and control logic

Delivering the pulses and timing for the SAR and takes care of the communication with the peripheral circuits.

Reference source

Based on the bandgap voltage of silicon, with extra temperature compensation circuit.

For the timing of the output signals see Fig. 3. At the leading edge of the start conversion (SC) pulse the ADC starts converting the input voltage. During the conversion cycle the following signals appear at the output pins:

Status (pin 2)

This signal can be used to force the Sample-Hold-Circuit, in front of the ADC, in hold mode.

Data strobe (pin 4)

This signal is used to clock the data-out signal into the peripheral devices.

Data out (pin 3)

The 14 bits serial, binary, output code of the A/D converter starting with the most significant bit (MSB). The data must be considered valid at the trailing edge of the data-strobe signal.

RATINGS

TDA1535

HIGH-SPEED SAMPLE AND HOLD AMPLIFIER

GENERAL DESCRIPTION

The TDA1535 is a high speed sample and hold amplifier with a total harmonic distortion of 0,001%, and a very high signal-to-noise ratio.

The excellent performance of the circuit makes it suitable for data acquisition systems with resolutions up to 16 bits, such as hi-fi digital audio equipment. The control input is TTL compatible.

Features

- High speed operational amplifier with two switchable inputs
- Wide band switchable class-B output stage
- High speed, low distortion operational amplifier with on chip JFET input stage
- Control circuit with TTL input

QUICK REFERENCE DATA

Positive supply voltage	V _P	typ.	5 V
Negative supply voltage	V _N	typ.	−5 V
Total harmonic distortion	THD	typ.	−100 dB
Signal-to-noise ratio	S/N	typ.	110 dB
Acquisition time to 0,001% (8 V step)	t _{AC}	typ.	2 μs
Small signal bandwidth	B	typ.	2 MHz
Droop rate	dV/dt	typ.	50 mV/s
Total power dissipation	P _{tot}	typ.	430 mW
Operating ambient temperature range	T _{amb}	−20 to + 70 °C	
Storage temperature range	T _{stg}	−55 to + 150 °C	

PACKAGE OUTLINE

16-lead DIL; plastic with internal heat spreader (SOT38).

This data sheet contains advance information and specifications are subject to change without notice.

TDA1541A

DUAL 16-BIT DAC

GENERAL DESCRIPTION

The TDA1541A is a monolithic integrated dual 16-bit digital-to-analogue converter (DAC) designed for use in hi-fi digital audio equipment such as Compact Disc players, digital tape or cassette recorders.

Features

- Selectable two-channel input format: offset binary or two's complement
- Internal timing and control circuit
- TTL compatible digital inputs
- High maximum input bit-rate and fast settling time
- No requirement for external deglitcher circuitry

FUNCTIONAL DESCRIPTION

The TDA1541A accepts input sample formats in time multiplexed mode or simultaneous mode with any bit length. The most significant bit (MSB) must always be first.

This flexible input data format allows easy interfacing with signal processing chips such as interpolation filters, error correction circuits, pulse code modulation adaptors and audio signal processors (ASP).

The high maximum input bit-rate and fast settling time facilitates application in 4 x oversampling systems (44,1 kHz to 176,4 kHz or 48 kHz to 192 kHz) with the associated simple analogue filtering function (low order, linear phase filter).

Input data selection (see also Table 1)

With input $\overline{OB}/TWC$ connected to ground, data input (offset binary format) must be in time multiplexed mode. It is accompanied with a word select (WS) and a bit clock input (BCK) signal. The converted samples appear at the output, at the first positive going transition of the bit clock signal after a negative going transition of the word select signal.

With $\overline{OB}/TWC$ connected to V_{DD} the mode is the same but the data format must be in two's complement.

When input $\overline{OB}/TWC$ is connected to V_{DD1} the two channels of data (L/R) are input simultaneously via DATA L and DATA R, accompanied with BCK and a latch-enable input (LE). With this mode selected the data must be in offset binary. The converted samples appear at the output at the positive going transition of the latch enable signal.

The format of data input signals is shown in figures 3 and 4.

True 16-bit performance is achieved by each channel using three 2-bit active dividers, operating on the dynamic element matching principle, in combination with a 10-bit passive current-divider, based on emitter scaling.

All digital inputs are TTL compatible.

Table 1 Input data selection

$\overline{OB}/TWC$	mode	pin 1	pin 2	pin 3	pin 4
-5 V	simultaneous	LE	BCK	DATA L	DATA R
0 V	time MUX OB	WS	BCK	DATA OB	not used
+ 5 V	time MUX TWC	WS	BCK	DATA TWC	not used

Where:

LE = latch enable
 WS = word select, LOW = left channel; HIGH = right channel
 BCK = bit clock
 DATA L = data left
 DATA R = data right
 DATA OB = data offset binary
 DATA TWC = data two's complement
 MUX OB = multiplexed offset binary
 MUX TWC = multiplexed two's complement = I²S – format.

TDA1542

ACTIVE ELEMENT FOR POST FILTERING.

GENERAL DESCRIPTION

The TDA1542 is a dual channel monolithic integrated circuit encapsulated in a 28 pin DIL plastic package. Each channel incorporates five high performance amplifiers and is designed for use in hi-fi digital audio equipment such as a compact disc player.

Features

- Mute function for click and plop free switching (on and off)
- Switch function for activating a de-emphasis circuit
- Two separate output amplifiers per channel
- Flexible use of filtering
- Extremely low distortion
- High slew-rate input amplifier

14	Ground right	28	+12 V supply voltage (V_{DD1})

FUNCTIONAL DESCRIPTION

The TDA1542 is a high performance, dual channel device designed to perform post filtering in a compact disc player. Since only the active part of the filter is integrated, the user has the option of selecting the desired filter type e.g. Bessel or Cauer etc. Each channel contains two separate output amplifiers, one with fixed gain for line output and the other with variable gain for driving low/high impedance headphones.

A switchable buffer amplifier is incorporated to enable the deemphasis function without producing clicks.

A mute circuit is incorporated to prevent spurious signals appearing at the output.

Both amplifiers are muted, for a preset period of time, when the 5 V supply is switched on or off.

An external capacitor determines the mute time. When the mute time has elapsed the signal path is switched directly to the output, without clicks. The mute circuit status is available externally.

The TDA1542 is designed to operate over a wide supply voltage range.

TDA1543

DUAL 16—BIT DAC (ECONOMY VERSION)

GENERAL DESCRIPTION

The TDA1543 is a monolithic integrated dual 16-bit digital-to-analogue converter (DAC) designed as an economy version for use in hi-fi digital audio equipment such as Compact Disc players, digital tape or cassette recorders.

Features

- Low distortion
- 16-bit dynamic range
- 4 x oversampling possible
- Single 5 V power supply
- No external components required
- No requirement for external deglitcher circuitry due to fast settling output current
- Adjustable bias current
- Internal timing and control circuits
- I²S input format: time multiplexed, two's complement, TTL

QUICK REFERENCE DATA

parameter	symbol	min.	typ.	max.	unit

Fig. 2 Pinning diagram.

(a) input pins BCK, WS and DATA.

(b) output pin V_{ref} .

(c) output pins AOL and AOR.

Fig. 3 Circuits at the input and output pins.

FUNCTIONAL DESCRIPTION

The TDA1543 accepts input serial data formats in two's complement with any bit length. Left and right data words are time multiplexed. The most significant bit (bit 1) must always be first. The format of data input is shown in Fig. 4.

This flexible input data format (I^2S) allows easy interfacing with signal processing chips such as interpolation filters, error correction circuits and audio signal processors (ASP).

The high maximum input bit-rate and fast settling current facilitates application in 4 x oversampling systems. An adjustable current is added to the output currents to bias output operational amplifiers (OP1; OP2) for maximum dynamic range (see Fig. 1).

With a LOW level on the word select (WS) input data is placed in the left input register and with a HIGH level on the WS input data is placed in the right input register. The data in the input registers is simultaneously latched in the output registers which control the bit switches.

The output current of the DAC is a sink current. The current I_{ref} at the V_{ref} output is adjusted by a resistor or a current source. The current I_{ref} is amplified with gain A_{Ibias} to the bias currents (I_{BL} ; I_{BR}) which are added to the output currents.

TDA1572

AM RECEIVER CIRCUIT

GENERAL DESCRIPTION

The TDA1572 integrated AM receiver circuit performs all the active functions and part of the filtering required of an AM radio receiver. It is intended for use in mains-fed home receivers and car radios. The circuit can be used for oscillator frequencies up to 50 MHz and can handle RF signals up to 500 mV.

RF radiation and sensitivity to interference are minimized by an almost symmetrical design. The controlled-voltage oscillator provides signals with extremely low distortion and high spectral purity over the whole frequency range, even when tuning with variable capacitance diodes. If required, band switching diodes can easily be applied. Selectivity is obtained using a block filter before the IF amplifier.

Features

- Inputs protected against damage by static discharge
- Gain-controlled RF stage
- Double balanced mixer
- Separately buffered, voltage-controlled and temperature-compensated oscillator, designed for simple coils
- Gain-controlled IF stage with wide AGC range
- Full-wave, balanced envelope detector
- Internal generation of AGC voltage with possibility of second-order filtering
- Buffered field strength indicator driver with short-circuit protection
- AF preamplifier with possibilities for simple AF filtering
- Electronic standby switch
- IF output for stereo demodulator and search tuning

Fig. 1 Block diagram and test circuit (connections shown in broken lines are not part of the test circuit).

FUNCTIONAL DESCRIPTION

Gain-controlled RF stage and mixer

The differential amplifier in the RF stage employs an AGC negative feedback network to provide a wide dynamic range. Very good cross-modulation behaviour is achieved by AGC delays at the various signal stages. Large signals are handled with low distortion and the (S+N)/N ratio of small signals is improved. Low noise working is achieved in the differential amplifier by using transistors with low base resistance.

A double balanced mixer provides the IF output signal to pin 1.

Oscillator

The differential amplifier oscillator is temperature compensated and is suitable for simple coil connection. The oscillator is voltage-controlled and has little distortion or spurious radiation. It is specially suitable for electronic tuning using variable capacitance diodes. Band switching diodes can easily be applied using the stabilized voltage V₁₃₋₁₈. An extra buffered oscillator putput (pin 12) is available for driving a synthesizer. If this is not needed, resistor R_{L(12)} can be omitted.

Gain-controlled IF amplifier

This amplifier comprises two cascaded, variable-gain differential amplifier stages coupled by a band-pass filter. Both stages are gain-controlled by the AGC negative feedback network. The IF output is available at pin 10.

Detector

The full-wave, balanced envelope detector has very low distortion over a wide dynamic range. Residual IF carrier is blocked from the signal path by an internal low-pass filter.

AF preamplifier

This stage preamplifies the audio frequency output signal. The amplifier output has an emitter follower with a series resistor which, together with an external capacitor, yields the required low-pass for AF filtering.

AGC amplifier

The AGC amplifier provides a control voltage which is proportional to the carrier amplitude. Second-order filtering of the AGC voltage achieves signals with very little distortion, even at low audio frequencies. This method of filtering also gives fast AGC settling time which is advantageous for electronic search tuning. The AGC settling time can be further reduced by using capacitors of smaller value in the external filter (C16 and C17). The AGC voltage is fed to the RF and IF stages via suitable AGC delays. The capacitor at pin 7 can be omitted for low-cost applications.

Field strength indicator output

A buffered voltage source provides a high-level field strength output signal which has good linearity for logarithmic input signals over the whole dynamic range. If the field strength information is not needed, R_{L(11)} can be omitted.

Standby switch

This switch is primarily intended for AM/FM band switching. During standby mode the oscillator, mixer and AF preamplifier are switched off.

Short-circuit protection

All pins have short-circuit protection to ground.

FUNCTIONAL DESCRIPTION

Gain-controlled RF stage and mixer

The differential amplifier in the RF stage employs an AGC negative feedback network to provide a wide dynamic range. Very good cross-modulation behaviour is achieved by AGC delays at the various signal stages. Large signals are handled with low distortion and the $(S + N)/N$ ratio of small signals is improved. Low noise working is achieved in the differential amplifier by using transistors with low base resistance.

A double balanced mixer provides the IF output signal to pin 1.

Oscillator

The differential amplifier oscillator is temperature compensated and is suitable for simple coil connection. The oscillator is voltage-controlled and has little distortion or spurious radiation. It is specially suitable for electronic tuning using variable capacitance diodes. Band switching diodes can easily be applied using the stabilized voltage V_{15-20} . An extra buffered oscillator output (pin 14) is available for driving a synthesizer. If this is not needed, resistor $R_L(14)$ can be omitted.

Gain-controlled IF amplifier

This amplifier comprises two cascaded, variable-gain differential amplifier stages coupled by a band-pass filter. Both stages are gain-controlled by the AGC negative feedback network. The IF output is available at pin 12.

Detector

The full-wave, balanced envelope detector has very low distortion over a wide dynamic range. Residual IF carrier is blocked from the signal path by an internal low-pass filter.

AF preamplifier

This stage preamplifies the audio frequency output signal. The amplifier output has an emitter follower with a series resistor which, together with an external capacitor, yields the required low-pass for AF filtering.

AGC amplifier

The AGC amplifier provides a control voltage which is proportional to the carrier amplitude. Second-order filtering of the AGC voltage achieves signals with very little distortion, even at low audio frequencies. This method of filtering also gives fast AGC settling time which is advantageous for electronic search tuning. The AGC settling time can be further reduced by using capacitors of smaller value in the external filter (C16 and C17). The AGC voltage is fed to the RF and IF stages via suitable AGC delays. The capacitor at pin 7 can be omitted for low-cost applications.

Field strength indicator output

A buffered voltage source provides a high-level field strength output signal which has good linearity for logarithmic input signals over the whole dynamic range. If the field strength information is not needed, $R_L(13)$ can be omitted.

Standby switch

This switch is primarily intended for AM/FM band switching. During standby mode the oscillator, mixer and AF preamplifier are switched off.

Short-circuit protection

All pins have short-circuit protection to ground.

RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

parameter	symbol	min.	max.	unit
Supply voltage (pin 17)	$V_P = V_{17-20}$	—	16	V

Table 1 Data for IF filters shown in Fig.10 (Filter 1 to 4) and Fig.11 (Filter 5). Criteria for adjustment is IF = maximum (optimum selectivity curve at centre frequency $f_0 = 455$ kHz). Filter 5 is used for AM stereo application with centre frequency $f_0 = 450$ kHz.

INTEGRATED FM TUNER FOR RADIO RECEIVERS

GENERAL DESCRIPTION

The TDA1574 is a monolithic integrated FM tuner circuit designed for use in the r.f./i.f. section of car radios and home-receivers. The circuit comprises a mixer, oscillator and a linear i.f. amplifier for signal processing, plus the following additional features.

Features

- Keyed automatic gain control (a.g.c.)
- Regulated reference voltage
- Buffered oscillator output
- Electronic standby switch
- Internal buffered mixer driving

QUICK REFERENCE DATA

Supply voltage range (pin 15)	V_P		7 to 16 V
Mixer input bias voltage (pins 1 and 2)	$V_{1,2-4}$	typ.	1 V
noise figure	NF	typ.	9 dB
Oscillator output voltage (pin 6)	V_{6-4}	typ.	2 V
output admittance at pin 6 for $f = 108,7$ MHz	Y22	typ.	$1,5 + j2$ mS
Oscillator output buffer			
D.C. output voltage (pin 9)	V_{9-4}	typ.	6 V
Total harmonic distortion	THD	typ.	-15 dBC
Linear i.f. amplifier output voltage (pin 10)	V_{10-4}	typ.	4,5 V
noise figure at $R_S = 300 \Omega$	NF	typ.	6,5 dB
Keyed a.g.c. output voltage range (pin 18)	V_{18-4}		+ 0,5 to $V_P - 0,3$ V

PACKAGE OUTLINE

18-lead DIL; plastic (SOT102).

Fig. 1 Block diagram and test circuit.

Coil data

- L1: TOKO MC-108, 514HNE-150014S14; L = 0.078 μ H
 L2: TOKO MC-111, E516HNS-200057; L = 0.08 μ H
 L3: TOKO coil set 7P, N1 = 5.5 + 5.5 turns, N2 = 4 turns

FUNCTIONAL DESCRIPTION**Mixer**

The mixer circuit is a double balanced multiplier with a preamplifier (common base input) to obtain a large signal handling range and a low oscillator radiation.

Oscillator

The oscillator circuit is an amplifier with a differential input. Voltage regulation is achieved by utilizing the symmetrical tanh-transfer-function to obtain low order 2nd harmonics.

Linear IF amplifier

The IF amplifier is a one stage, differential input, wideband amplifier with an output buffer.

Keyed AGC

The AGC processor combines narrow- and wideband information via an RF level detector, a comparator and an ANDing stage. The level dependent, current sinking output has an active load, which sets the AGC threshold.

The AGC function can either be controlled by a combination of wideband and narrowband information (keyed AGC), or by a wideband information only, or by narrowband information only. If only narrowband AGC is wanted pin 3 should be connected to pin 5. If only wideband AGC is wanted pin 12 should be connected to pin 13.

RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 15)	$V_P = V_{15-4}$	max.	18 V
Mixer output voltage (pins 16 and 17)	$V_{16, 17-4}$	max.	35 V
Standby switch input voltage (pin 11)	V_{11-4}	max.	23 V
Reference voltage (pin 5)	V_{5-4}	max.	7 V
Field strength input voltage (pin 12)	V_{12-4}	max.	7 V

TDA1574T

INTEGRATED FM TUNER FOR RADIO RECEIVERS

GENERAL DESCRIPTION

The TDA1574T is an integrated FM tuner circuit designed for use in the RF/IF section of car radios and home-receivers. The circuit contains a mixer and an oscillator and a linear IF amplifier for signal processing. The circuit also incorporates the following features.

Features

- Keyed Automatic Gain Control (AGC)
- Regulated reference voltage
- Buffered oscillator output
- Electronic standby switch
- Internal buffered mixer driving

QUICK REFERENCE DATA

20. AGC output

FUNCTIONAL DESCRIPTION**Mixer**

The mixer circuit uses a double balanced multiplier with a preamplifier (common base input) in order to obtain a large signal handling range and low oscillator radiation.

Oscillator

The oscillator circuit uses an amplifier with a differential input. Voltage regulation is achieved by utilizing the symmetrical tan h-transfer-function to obtain low order 2nd harmonics.

Linear IF amplifier

The IF amplifier is a one stage, differential input, wideband amplifier with an output buffer.

Keyed AGC

The AGC processor combines narrow and wideband information via an RF level detector, a comparator and an ANDing stage. The level dependent current sinking output has an active load which sets the AGC threshold.

The AGC function can either be controlled by a combination of wideband and narrowband information (keyed AGC) or by a wideband/narrowband information only. If narrowband AGC is required pin 3 should be connected to pin 5. If wideband AGC is required pin 14 should be connected to pin 15.

RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

parameter	conditions	symbol	min.	max.	unit
Supply voltage (pin 17)		V_{17-4}	—	14	V
Mixer output voltage (pins 18 and 19)		$V_{18,19-4}$	—	35	V
Standby switch input voltage (pin 13)		V_{13-4}	—	23	V
Reference voltage (pin 5)		V_{5-4}	—	7	V
Total power dissipation		P_{tot}	—	500	mW
Storage temperature range		T_{stg}	−55	+ 150	°C
Operating ambient temperature range		T_{amb}	−40	+ 85	°C

THERMAL RESISTANCE

From junction to ambient (in free air)

$$R_{th\,j-a} = 95 \text{ K/W}$$

Note to the ratings

All pins are short-circuit protected to ground.

CHARACTERISTICS

$V_P = V_{17.4} = 8.5 \text{ V}$; $T_{\text{amb}} = 25 \text{ }^{\circ}\text{C}$; measured in test circuit Fig.1;

All measurements are with respect to ground (pin 4); unless otherwise specified

Notes to the characteristics

1. Power gain conversion is equated by the following equation:

$$10 \log \frac{4 (V_{M(out)} 10.7 \text{ MHz})^2}{(EMF1 98 \text{ MHz})^2} \times \frac{R_{S1}}{R_{ML}}$$

2. Voltage gain is equated by the following equation:

$$20 \log \frac{V_{12}}{V_{16-15}}$$

FM/IF AMPLIFIER CIRCUIT

The TDA1576 is a monolithic integrated f.m./i.f. amplifier circuit provided with the following functions:

- symmetrical limiting i.f. amplifier
- symmetrical quadrature demodulator
- internal muting circuit
- symmetrical a.f.c. output
- field-strength indication output
- detune-detector
- reference voltage output
- electronic smoothing of the supply voltage
- standby on/off switching circuit.

QUICK REFERENCE DATA

$f_o = 10,7 \text{ MHz}$; $\Delta f = \pm 22,5 \text{ kHz}$; $f_m = 400 \text{ Hz}$; $Q_L = 20$; de-emphasis $\tau = 50 \mu\text{s}$

Fig. 12 Application example of using TDA1576.

TIME MULTIPLEX PLL STEREO DECODER

GENERAL DESCRIPTION

The TDA1578A is a PLL stereo decoder based on the time-division multiplex principle.

Features

- adjustable input and output voltage levels
- automatic mono/stereo switching with hysteresis, controlled by both pilot signal and field strength level
- analogue control of mono/stereo change over
- pilot indicator driver
- analogue muting control
- muting indicator driver
- oscillator with decoupled frequency measurement output
- electronic smoothing of the supply voltage

QUICK REFERENCE DATA

Notes to the characteristics

1. Intermodulation suppression (BFC: Beat-Frequency Components)

$$\alpha_2 = \frac{V_o(\text{signal}) \text{ (at 1 kHz)}}{V_o(\text{spurious}) \text{ (at 1 kHz)}}; f_s = (2 \times 10 \text{ kHz}) - 19 \text{ kHz}$$

$$\alpha_3 = \frac{V_o(\text{signal}) \text{ (at 1 kHz)}}{V_o(\text{spurious}) \text{ (at 1 kHz)}}; f_s = (3 \times 13 \text{ kHz}) - 38 \text{ kHz}$$

measured with: 91% mono signal; $f_m = 10$ or 13 kHz; 9% pilot signal.

2. Traffic radio (V.W.F.) suppression

$$\alpha_{57}(\text{VWF}) = \frac{V_o(\text{signal}) \text{ (at 1 kHz)}}{V_o(\text{spurious}) \text{ (at 1 kHz} \pm 23 \text{ kHz)}}$$

measured with: 91% stereo signal; $f_m = 1$ kHz; 9% pilot signal;
5% traffic subcarrier ($f = 57$ kHz, $f_m = 23$ Hz AM, $m = 60\%$).

3. ACI (Adjacent Channel Interference)

$$\alpha_{114} = \frac{V_o(\text{signal}) \text{ (at 1 kHz)}}{V_o(\text{spurious}) \text{ (at 4 kHz)}}; f_s = 110 \text{ kHz} - (3 \times 38 \text{ kHz})$$

$$\alpha_{190} = \frac{V_o(\text{signal}) \text{ (at 1 kHz)}}{V_o(\text{spurious}) \text{ (at 4 kHz)}}; f_s = 186 \text{ kHz} - (5 \times 38 \text{ kHz})$$

measured with: 90% mono signal; $f_m = 1$ kHz; 9% pilot signal;
1% spurious signal ($f_s = 110$ or 186 kHz, unmodulated).

4. SCA (Subsidiary Communications Authorization)

$$\alpha_{67} = \frac{V_o(\text{signal}) \text{ (at 1 kHz)}}{V_o(\text{spurious}) \text{ (at 9 kHz)}}; f_s = (2 \times 38 \text{ kHz}) - 67 \text{ kHz}$$

measured with: 81% mono signal; $f_m = 1$ kHz; 9% pilot signal;
10% SCA-subcarrier ($f_s = 67$ kHz, unmodulated).

5. Assuming $V_T = \frac{k \times T}{q} = 28,6 \text{ mV}$ at $T_j = 330 \text{ K}$.

6. The effects of external components are not taken into account.

APPLICATION NOTES

1. When mono/stereo control and muting control are not used, pins 3, 4 and 5 have to be grounded.
2. In a receiver, channel separation adjustment can be obtained by:
 - a. A capacitor at pin 12 ($C_{12.7}$): phasing 19/38 kHz
 - b. RC or LCR filter at the input: frequency response compensation ($V_G = f(\omega)$)
 - c. Feeding the output signals of the output amplifier to the inputs of the other channel.
3. PLL-filter for reduced intermodulation (α_2); see Fig. 2.
4. External mono 'ON' switch; see Fig. 3.
5. Switching 'OFF' the oscillator; see Fig. 4.

Fig. 2 PLL-filter for $\alpha_2 = 70$ dB at $V_p = 15$ V (see also Fig. 1).

Fig. 15 Application information for external circuitry to provide external mono/stereo and muting control.

Adjustment recommendations:

at $V_{i(hf)} = 100 \mu V$ with P1 to $\alpha = 6$ dB (channel separation),

at $V_{i(hf)} = 15 \mu V$ with P2 to $V_{o(af)} = -3$ dB.

DECODER FOR TRAFFIC WARNING (VWF) RADIO TRANSMISSIONS

GENERAL DESCRIPTION

The TDA1579 decoder is for radio transmissions having 57 kHz amplitude-modulated subcarriers as used in the German 'Verkehrs Warnfunk' (VWF) traffic warning system.

Features

- Selective subcarrier amplifier (57 kHz) with gain control
- Transmitter identification signal (SK) decoder
- Area identification signal (BK) and announcement identification signal (DK) active filtering
- BK and DK decoders (Schmitt trigger with switched hysteresis)
- BK and DK switch-on/switch-off delay circuits
- Driver output for SK indicator (LED)
- SK and BK control outputs

QUICK REFERENCE DATA

Measured in Fig. 1 at $V_{iSK} = 8 \text{ mV}$; $f = 57 \text{ kHz}$ amplitude modulated with $f_m = 34.95 \text{ Hz}$ and $m = 60\%$ for 'BK-traffic area C' signal; or with $f_m = 125 \text{ Hz}$ and $m = 30\%$ for DK signal

parameter	conditions	symbol	min.	typ.	max.	unit

Notes

1. Sequence for measuring switch-on delay times (t_{don})

- Nominal BK or DK input signal at pin 13: $V_{i(p-p)} = 8\text{ mV}$; $f = 57\text{ kHz}$; modulation-on.
- Pin 4 of the BK detector (pin 16 of the DK detector) is switched to ground to cause a low signal at the SK output at pin 3 (DK output at pin 2).
- t_{don} commences when the ground connection is removed from pin 4 (pin 16) as the positive-going V_{OBK} signal at pin 5 (V_{ODK} signal at pin 15) crosses zero.
 t_{don} ends when the positive-going edge of the SK output arrives at pin 13 (DK at pin 2).

2. Sequence for measuring switch-off delay times (t_{doff})

- Nominal operating conditions as in note 1.
- t_{doff} commences when the input is switched off as the negative-going V_{OBK} signal at pin 5 (V_{ODK} signal at pin 15) crosses zero.
 t_{doff} ends when the negative-going edge of the SK output arrives at pin 3 (DK at pin 2).

TRAFFIC CONTROL MESSAGES AND WARNING TONE CIRCUIT

The TDA1589 is for evaluation of operating signals and logic control signals of a traffic control (TC) message decoder.

Features

- mute of non-traffic control stations
- restriction to traffic-control message reception
- LED display driver for MUTE indication
- control output for TC messages minimum volume
- delayed start of warning tone signal on failure of TC transmission. Also to be used to control a start of search tuning
- warning tone generator with automatic level control increasing volume in five steps
- interruption of cassette playback with motor stop during TC messages
- warning tone indicating failure of TC transmission also during cassette playback

PACKAGE OUTLINE

18-lead DIL; plastic (SOT102).

Fig. 1 Block diagram with external components; used as test circuit.

BK = TC area identification code (BereichsKennung)

DK = TC message identification code (DurchsageKennung)

SK = TC station identification code (SenderKennung)

Fig. 2 Intermittent step pulse warning signal.

FUNCTIONAL DESCRIPTION

The automatic evaluation of traffic control signals is only possible during FM reception. The enable circuit will be active when pin 16 (FM on) is LOW. If traffic control messages are desired, pin 2 (TC on) must be switched to LOW.

FM radio mode

By operating the DK-toggle switch at pin 1 the DK flip-flop is set. This is displayed by a LED connected to pin 3. In the position "TC off" (pin 2 HIGH) it is not possible to set the DK flip-flop. Non-traffic control stations are muted. If a message is transmitted on the tuned TC station the minimum volume at pin 7 is exposed.

In case of BK-signal failure pin 13 changes to LOW after a delay of about 25 seconds. If pins 13 and 14 are then connected, an intermittent warning signal will be supplied at pin 12. The level increases automatically from -20 dB to 0 dB in 5 steps. (See Fig. 2.)

Cassette mode

If a TC message is delivered when TC is switched on (pin 16 and pin 2 LOW) and the DK flip-flop is set, the motor of the cassette player is stopped and the receiver automatically cuts in. The minimum volume is also set at the same time.

In case of BK-signal failure, the warning tone will be mixed into the cassette playback.

Protection

To avoid faulty switching, an internal latch will be set only if both DK (pin 18) and BK (pin 17) are HIGH. The latch will be reset if DK is changed to LOW independent of BK.

Reset of the DK-toggle flip-flop:

- by operating the DK-toggle (pin 1) twice
- by opening the TC-switch (pin 2)
- by switching to AM reception (pin 16)
- by switching off the cassette-player (pin 15)
- by switching power off or on.

Transmission monitoring

At reception failure of a TC-station BK at pin 17 will become LOW. After about 25 seconds the output (pin 13) will be set LOW to start the warning signal via the jumper between pins 13 and 14. In the meantime the search-tuning can also be started. The warning tone stage gives a graduated signal with a level increasing in five steps from -20 dB to 0 dB in about 20 seconds. The frequency of the warning signal is about 600 Hz; tone period ≈ 80 ms; pause ≈ 560 ms.

If now another TC-message transmitter has been tuned the input BK (pin 17) becomes HIGH and the warning tone is stopped. Also when switching TC-off (pin 2 HIGH) or switching to AM reception (pin 16 HIGH) the warning tone will stop. The BK-signal has to be stable for more than 1 second to reset the just started 25-second-timer.

TDA1596

IF AMPLIFIER/DEMODULATOR FOR FM RADIO RECEIVERS

GENERAL DESCRIPTION

The TDA1596 provides IF amplification, symmetrical quadrature demodulation and level detection for quality home and car FM radio receivers and is suitable for both mono and stereo reception. It may also be applied to common front-ends, stereo decoders and AM receiver circuits.

Features

- Simulates behaviour of a ratio detector (internal field strength and detuning-dependent voltage for dynamic AF signal muting)
- Mono/stereo blend and field strength indication control voltage
- Three-state mode switch for FM, mute-on / FM, mute-off / FM-off
- Internal compensation of AF signal total harmonic distortion (THD)
- Two open collector stop pulse outputs for microcomputer tuning control (can be one stop pulse output by wired-ANDing)
- Internal reference voltage source
- Built-in hum and ripple rejection circuits

FUNCTIONAL DESCRIPTION

Limiter-amplifier

This has five stages of IF amplification using balanced differential limiter-amplifiers with emitter-follower coupling. Decoupling of the stages from the voltage supply lines and an internal high-ohmic DC feed-back loop give a very stable IF performance. The amplifier gain is virtually independent from temperature changes.

FM demodulator

The demodulator is fully balanced and comprises two cross-coupled differential amplifiers. Quadrature detection of the FM signal is performed by feeding one differential amplifier directly from the limiter-amplifier output, and the other via an external 90° phase-shifting network. The demodulator has good stability and its zero cross-over shift is small. The bandwidth of the demodulator output is restricted to approximately 1 MHz by an internal low-pass filter.

THD compensation

This circuit compensates non-linearities introduced by demodulation. For this to operate correctly the demodulator circuit between pins 9 and 10 must have a loaded Q-factor of 19. Consequently there is no need for the demodulator tuned circuit to be adjusted for minimum THD, instead the adjustment criterium is for a symmetrical stop pulse.

Mute attenuator and AF output

The control voltage for the mute attenuator at pin 14 is generated from the values of the level detector and the detuning detector outputs. The mute attenuator has a fast attack and a slow decay which is determined by the capacitor at pin 14. The AF signal is passed via the mute attenuator to the output at pin 4.

A weighted control voltage, available from pin 6, is obtained from the mute attenuator control voltage via a buffer-amplifier which introduces an additional voltage shift and gain.

Level detector

The level detector generates a voltage output which is proportional to the field strength of the input signal. The unweighted level detector output is available when the mode switch is operating in the FM, mute-on condition.

Tuning-stop outputs

The open collector outputs STOP-0 and STOP-1 (from pins 13 and 12 respectively) are voltages derived from the detuning level and the field strength of the input signal. If only one tuning-stop output is required, pins 12 and 13 may be tied together.

TDA1596T

IF AMPLIFIER/DEMODULATOR FOR FM RADIO RECEIVERS

GENERAL DESCRIPTION

The TDA1596T provides IF amplification, symmetrical quadrature demodulation and level detection for quality home and car FM radio receivers and is suitable for both mono and stereo reception. It may also be applied to common front-ends, stereo decoders and AM receiver circuits.

Features

- Simulates behaviour of a ratio detector (internal field strength and detuning-dependent voltage for dynamic AF signal muting)
- Mono/stereo blend and field strength indication control voltage
- Three-state mode switch for FM, mute-on / FM, mute-off / FM-off
- Internal compensation of AF signal total harmonic distortion (THD)
- Two open collector stop pulse outputs for microcomputer tuning control (can be one stop pulse output by wired-ANDing)
- Internal reference voltage source
- Built-in hum and ripple rejection circuits

SEE ALSO DATA SHEET FOR TDA1596

PACKAGE OUTLINE

20-lead mini-pack; plastic (SO20; SOT163A).

- (1) Two different time constants can be chosen for the multipath detection network by connecting pin 13 to ground or to V_{ref}.
- (2) In the FM, mute-on condition the unweighted level detector output is available from pin 3. In the FM, mute-off condition the variable resistor at pin 3 can be adjusted for minimum 2nd harmonic distortion at pin 4.

FUNCTIONAL DESCRIPTION

Limiter-amplifier

This has five stages of IF amplification using balanced differential limiter-amplifiers with emitter-follower coupling. Decoupling of the stages from the voltage supply lines and an internal high-ohmic DC feed-back loop give a very stable IF performance. The amplifier gain is virtually independent from temperature changes.

FM demodulator

The demodulator is fully balanced and comprises two cross-coupled differential amplifiers. Quadrature detection of the FM signal is performed by feeding one differential amplifier directly from the limiter-amplifier output, and the other via an external 90° phase-shifting network. The demodulator has good stability and its zero cross-over shift is small. The bandwidth of the demodulator output is restricted to approximately 1 MHz by an internal low-pass filter.

THD compensation

This circuit compensates non-linearities introduced by demodulation. For this to operate correctly the demodulator circuit between pins 10 and 11 must have a loaded Q-factor of 19. Consequently there is no need for the demodulator tuned circuit to be adjusted for minimum THD, instead the adjustment criterium is for a symmetrical stop pulse.

Mute attenuator and AF output

The control voltage for the mute attenuator at pin 16 is generated from the values of the level detector and the detuning detector outputs. The mute attenuator has a fast attack and a slow decay which is determined by the capacitor at pin 16. The AF signal is passed via the mute attenuator to the output at pin 4.

A weighted control voltage, available from pin 6, is obtained from the mute attenuator control voltage via a buffer-amplifier which introduces an additional voltage shift and gain.

Level detector

The level detector generates a voltage output which is proportional to the field strength of the input signal. The unweighted level detector output is available when the mode switch is operating in the FM, mute-on condition.

Tuning-stop outputs

The open collector outputs STOP-0 and STOP-1 (from pins 15 and 14 respectively) are voltages derived from the detuning level and the field strength of the input signal. If only one tuning-stop output is required, pins 14 and 15 may be tied together.

TDA1598

TIME MULTIPLEX PLL STEREO DECODER

GENERAL DESCRIPTION

The TDA1598 is a PLL stereo decoder based on the time-division multiplex principle.

Features

- Selectable input and output voltage levels
- Automatic mono/stereo switching
- Analogue control of mono/stereo change over (stereo blend)
- Pilot indicator driver
- Oscillator with decoupled frequency measurement output
- Internal smoothing of supply voltage

QUICK REFERENCE DATA

Supply voltage, pin 8	$V_P = V_{8-7}$	typ.	8,5 V
Supply current, pin 8	$I_P = I_8$	typ.	17 mA
Multiplex input signal (selectable)	$V_{MUX(p-p)}$	typ.	0,5 V
Input resistance (selectable)	R_i	typ.	47 k Ω
AF output voltage ($R = 15$ k Ω)	$V_{O(rms)}$	typ.	0,75 V
Output resistance	R_o	low-ohmic	
Spread in gain	Δ	<	1 dB
Channel separation	α	typ.	50 dB
Total harmonic distortion	THD	<	0,5 %
Signal plus noise-to-noise ratio	(S+N)/N	typ.	90 dB
Carrier and harmonic suppression			
pilot signal; $f = 19$ kHz	α_{19}	typ.	32 dB

Notes to the characteristics

1. Intermodulation suppression (BFC: Beat-Frequency Components)

$$\alpha_2 = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 1 kHz)}} ; f_s = (2 \times 10 \text{ kHz}) - 19 \text{ kHz}$$

$$\alpha_3 = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 1 kHz)}} ; f_s = (3 \times 13 \text{ kHz}) - 38 \text{ kHz}$$

measured with: 91% mono signal; $f_m = 10$ or 13 kHz; 9% pilot signal.

2. Traffic radio (VF) suppression.

$$\alpha_{57(\text{VF})} = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 1 kHz} \pm 23 \text{ Hz)}}$$

measured with: 91% stereo signal; $f_m = 1$ kHz; 9% pilot signal; 5% traffic subcarrier ($f = 57$ kHz, $f_m = 23$ Hz AM, $m = 60\%$).

3. ACI (Adjacent Channel Interference)

$$\alpha_{114} = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 4 kHz)}} ; f_s = 110 \text{ kHz} - (3 \times 38 \text{ kHz})$$

measured with: 90% mono signal; $f_m = 1$ kHz; 9% pilot signal; 1% spurious signal ($f_s = 110$ kHz or 186 kHz, unmodulated).

4. SCA (Subsidiary Communications Authorization)

$$\alpha_{67} = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 9 kHz)}} ; f_s = (2 \times 38 \text{ kHz}) - 67 \text{ kHz}$$

measured with: 81% mono signal; $f_m = 1$ kHz; 9% pilot signal; 10% SCA-subcarrier ($f_s = 67$ kHz, unmodulated).

5. The effects of external components are not taken into account.

APPLICATION NOTES

1. When mono-stereo control is not used, pins 4 and 5 have to be grounded.
2. In a receiver, channel separation can be adjusted by:
 - a. RC or LC filter at the input: frequency response compensation ($V_G = f(w)$).
 - b. Feeding the output signals of the output amplifier to the inputs of the other channel.
3. PLL-filter for reduced intermodulation (a_2); see Fig. 2.
4. External mono 'ON' switch; see Fig. 3.
5. Switching 'OFF' the oscillator; see Fig. 4.

TDA1600

MULTI-FUNCTION OSCILLATOR SWITCH FOR AN AUDIO CASSETTE RECORDER

GENERAL DESCRIPTION

The TDA1600 is a bipolar circuit designed for high fidelity cassette recorders. This device contains several functions (see 'features') which can be selected by external d.c. voltage levels or via a micro-processor. The TDA1600 operates from a mains-fed asymmetrical power supply. For application purposes the voltage output can be either $\frac{1}{2} V_P$ asymmetrical or $\frac{1}{2} V_P$ symmetrical. The output of all the functions are current protected.

Features

- Stereo playback amplifier
- Electronic switch for playback equalization
- Electronic head-switch (two times)
- Erase and bias oscillator
- LED driver
- Tape selector
- Reference voltage source ($\frac{1}{2} V_P$)
- Logic part

FUNCTIONAL DESCRIPTION

Playback amplifier

The playback amplifier is a low noise pre-amplifier which is internally connected to the head-switch. The gain of the amplifier can be externally fixed, to provide an optimal output voltage for a noise reduction system (e.g. Dolby). The playback constants (70 μ s and 120 μ s) are determined by external components, while the switch over is controlled by the logic part of the circuit. In the record mode, the playback amplifier is switched OFF.

Head-switch

The electronic head-switch has two positions:

- record mode: the playback side of the head is switched to signal ground, while the recording side is opened to allow the bias and audio current to be fed to the head.
- playback mode: the recording side of the head is switched to signal ground, while the playback side is connected to the input of the playback amplifier.

Both of these positions are controlled by the logic part of the circuit.

Erase and bias oscillator

Every audio hi-fidelity cassette recorder contains a high frequency bias current for linearization of the magnetic recording process on the tape. The high frequency bias current is added to the audio current (from a recording amplifier) and fed into the recording head. The oscillator generates a voltage which is converted into a bias current by an external resistor. The oscillator output voltage is dependent upon the type of tape selected; Ferro (FeO_2), Chrome (CrO_2) or Metal. The selection of the voltage level is controlled by the logic part, while the ratio level is determined by four external resistors. The oscillator also provides the current necessary for erasing the tape. The bias oscillator is only activated during the record mode.

LED driver

This circuit provides the voltage which drives the LED tape indicator. The circuit has three output positions; 0, $\frac{1}{2} V_P$ or V_P , all of which are controlled by the logic part of the device.

Reference voltage

The circuit delivers an output voltage which is half the supply voltage. By using this output as signal ground, a symmetrical power supply is available ($+\frac{1}{2} V_P$ and $-\frac{1}{2} V_P$), which can be used for the overall recording system. This application allows some flexibility in the choice of other IC's and components for the overall system.

Logic part

The logic part converts the incoming information, from the tape selector switches and from the record/playback switch, into the necessary switching signals. The switching signals are required for the analogue parts of the circuit. This conversion is determined by the input signal level and is independent of the rise or fall-time of this signal.

Notes to the characteristics

1. The supply current is measured in the test circuit without loading the LED driver or the additional load of the $\frac{1}{2} V_p$ amplifier. In the record mode the tape selector is at Metal position.
2. The closed loop gain will be fixed by R_{FeO_2} in the FeO₂ position, by R_{FeO_2}/R_{CrO_2} in the CrO₂ position and by R_{FeO_2}/R_{CrO_2} in the Metal position. The gain of the amplifier must not be lower than 30 dB.
3. The S/N ratio is related to $V_O = 50 \text{ mV}$ (at $f = 315 \text{ Hz}$) and $R_S = 1 \text{ k}\Omega$.
4. The oscillator frequency is determined by L and C_L and may be adjusted between 60 kHz and 120 kHz.
5. The voltage applied to the control inputs (pins 15, 16 and 17) is $-(V_p - 2 \text{ V})$ min. and -2 V max. with respect to V_p .
6. The output voltage is independent of the operating mode (playback/record).

5 W AUDIO POWER AMPLIFIER

The TDA2611A is a monolithic integrated circuit in a 9-lead single in-line (SIL) plastic package with a high supply voltage audio amplifier. Special features are:

- possibility for increasing the input impedance
- single in-line (SIL) construction for easy mounting
- very suitable for application in mains-fed apparatus
- extremely low number of external components
- thermal protection
- well defined open loop gain circuitry with simple quiescent current setting and fixed integrated closed loop gain

QUICK REFERENCE DATA

Supply voltage range	V_P		6 to 35 V

RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage	V_p	max.	35 V
Non-repetitive peak output current	I_{OSM}	max.	3 A
Repetitive peak output current	I_{ORM}	max.	1,5 A
Total power dissipation	see derating curves Fig. 2		
Storage temperature	T_{stg}	-55 to + 150 °C	
Operating ambient temperature	T_{amb}	-25 to + 150 °C	

Fig. 2 Power derating curves.

HEATSINK EXAMPLE

Assume $V_p = 18$ V; $R_L = 8 \Omega$; $T_{amb} = 60$ °C maximum; $T_j = 150$ °C (max. for a 4 W application into an 8Ω load, the maximum dissipation is about 2,2 W).

The thermal resistance from junction to ambient can be expressed as:

$$R_{th j-a} = R_{th j-tab} + R_{th tab-h} + R_{th h-a} = \frac{150 - 60}{2,2} = 41 \text{ K/W.}$$

Since $R_{th j-tab} = 11$ K/W and $R_{th tab-h} = 1$ K/W, $R_{th h-a} = 41 - (11 + 1) = 29$ K/W.

TDA2613

6 W HI-FI AUDIO POWER AMPLIFIER

GENERAL DESCRIPTION

The TDA2613 is a hi-fi audio power amplifier encapsulated in a 9-lead SIL plastic power package. The device is especially designed for mains fed applications (e.g. tv and radio).

Features

- Requires very few external components
- Input muted during power-on and off (no switch-on or switch-off clicks)
- Low offset voltage between output and ground
- Hi-fi according to IEC 268 and DIN 45500
- Short-circuit-proof
- Thermally protected

QUICK REFERENCE DATA

Supply voltage range	V_p		15 to 40 V
Output power at THD = 0,5%, $V_p = 24$ V	P_o	typ.	6 W
Voltage gain	G_v	typ.	30 dB
Supply voltage ripple rejection	SVRR	typ.	60 dB
Noise output voltage	$V_{no(rms)}$	typ.	70 μ V

PACKAGE OUTLINE

TDA2613: 9-lead SIL; plastic power (SOT110B).

Fig. 1 Block diagram.

PINNING

- | | | | | | |
|----|-------------------|---|----|-----------------|--|
| 1. | n.c. | not connected | 5. | GND | { ground (asymmetrical)
negative supply (symmetrical) |
| 2. | n.c. | not connected | 6. | OUT | output |
| 3. | V _p /2 | { ½ V _p (asymmetrical)
ground (symmetrical) | 7. | +V _p | positive supply |
| 4. | n.c. | not connected | 8. | INV | inverting input |
| | | | 9. | –INV | non-inverting input |

FUNCTIONAL DESCRIPTION

This hi-fi power amplifier is designed for mains fed applications. The device is intended for asymmetrical power supplies, but a symmetrical supply may also be used. An output power of 6 watts (THD = 0,5%) can be delivered into an 8 Ω load with an asymmetrical power supply of 24 V.

The gain is fixed internally at 30 dB. Internal gain fixing gives low gain spread.

A special feature of this device is a mute circuit which suppresses unwanted input signals during switching on and off. Referring to Fig. 4, the 100 μF capacitor creates a time delay when the voltage at pin 3 is lower than an internally fixed reference voltage. During the delay the amplifier remains in the DC operating mode but is isolated from the non-inverting input on pin 9.

Two thermal protection circuits are provided, one monitors the average junction temperature and the other the instantaneous temperature of the power transistors. Both protection circuits activate at 150 °C allowing safe operation to a maximum junction temperature of 150 °C without added distortion.

RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

parameter	conditions	symbol	min.	max.	unit
Supply voltage	see Fig. 2	V _p	—	40	V
Non-repetitive peak output current		I _{OSM}	—	4	A
Total power dissipation		P _{tot}			
Storage temperature range		T _{stg}	−65	+ 150	°C
Junction temperature	see note	T _j	—	150	°C
Short-circuit time: outputs short-circuited to ground (full signal drive)		t _{sc}	—	1	hour

Note to the Ratings

For asymmetrical power supplies (at short-circuiting of the load) the maximum supply voltage is limited to V_p = 28 V. If the total internal resistance of the supply (R_S) ≥ 4 Ω, the maximum unloaded supply voltage is increased to 32 V. For symmetrical power supplies the circuit is short-circuit proof to V_p = ± 20 V.

DEVELOPMENT DATA

Fig. 2 Power derating curve.

THERMAL RESISTANCE

From junction to case

$$R_{th\ j-c} = 8\ K/W$$

HEATSINK DESIGN EXAMPLE

With derating of 8 K/W, the value of heatsink thermal resistance is calculated as follows:

given $R_L = 8\ \Omega$ and $V_p = 24\ V$, the measured maximum dissipation is 4,1 W; then, for a maximum ambient temperature of 60 °C, the required thermal resistance of the heatsink is :

$$R_{th\ h-a} = \frac{150 - 60}{4,1} - 8 \approx 14\ K/W$$

Note: The metal tab (heatsink) has the same potential as pin 5 (GND).

APPLICATION INFORMATION

Fig. 3 Test and application circuit; symmetrical power supply.

Fig. 4 Test and application circuit; asymmetrical power supply.

APPLICATION INFORMATION (continued)**Input mute circuit**

The input mute circuit operates only during switching on and off of the supply voltage. The circuit compares the $\frac{1}{2}$ supply voltage (at pin 3) with an internally fixed reference voltage (V_{ref}), derived directly from the supply voltage. When the voltage at pin 3 is lower than V_{ref} the non-inverting input (pin 9) is disconnected from the amplifier. The voltage at pin 3 is determined by an internal voltage divider and the external $100\ \mu\text{F}$ capacitor.

During switching on, a time delay is created between the reference voltage and the voltage at pin 3, during which the input terminal is disconnected, (as illustrated in Fig. 5).

Fig. 5 Input mute circuit; time delay.

INFRARED RECEIVER

The TDA3047 is for infrared reception with low power consumption.

The difference between the TDA3047 and TDA3048 is the polarity of the output signal.

Features

- H.F. amplifier with a control range of 66 dB
- Synchronous demodulator and reference amplifier
- A.G.C. detector
- Pulse shaper
- Q-factor killing of the input selectivity, which is controlled by the a.g.c. circuit
- Input voltage limiter

TDA3047T: 16-lead mini-pack; plastic (SO16L; SOT162A).

FUNCTIONAL DESCRIPTION

General

The circuit operates from a 5 V supply and has a current consumption of 2 mA. The output is a current source which can drive or suppress a current of $> 75 \mu\text{A}$ with a voltage swing of 4,5 V. The Q-killer circuit eliminates distortion of the output pulses due to the decay of the tuned input circuit at high input voltages. The input circuit is protected against signals of $> 600 \text{ mV}$ by an input limiter. The typical input is an AM signal at a frequency of 36 kHz. Figures 3 and 4 show the circuit diagrams for the application of narrow-band and wide-band receivers respectively. Circuit description of the eight sections shown in Fig. 1 are given below.

Controlled h.f. amplifier

The input signal is amplified by the gain-controlled amplifier. This circuit comprises three d.c. amplifier stages connected in cascade. The overall gain of the circuit is approximately 83 dB and the gain control range is in the order of 66 dB. Gain control is initially active in the second amplifier stage and is transferred to the first stage as limiting in the second stage occurs, thus maintaining optimum signal-to-noise ratio. Offset voltages in the d.c. coupled amplifier are minimized by two negative feedback loops; these also allow the circuit to have some series resistance of the decoupling capacitor. The output signal of the amplifier is applied to the reference amplifier and to the synchronous demodulator inputs.

Reference amplifier

The reference amplifier amplifies and limits the input signal. The voltage gain is approximately 0 dB. The output signal of this amplifier is applied to the synchronous demodulator.

Synchronous demodulator

In the synchronous demodulator the input signal and reference signal are multiplied. The demodulator output current is $25 \mu\text{A}$ peak-to-peak. The output signal of the demodulator is fed to the input of the a.g.c. detector and to the input of the pulse-shaper circuit.

A.G.C. detector

The a.g.c. detector comprises two n-p-n transistors operating as a differential pair. The top level of the output signal from the synchronous demodulator is detected by the a.g.c. circuit. Noise pulses are integrated by an internal capacitor. The output signal is amplified and applied to the first and second stages of the amplifier and to the Q-factor killer circuit.

Pulse-shaper

The pulse-shaper comprises two n-p-n transistors operating as a differential pair connected in parallel with the a.g.c. differential pair. The slicing level of the pulse shaper is lower than the slicing level of the a.g.c. detector. The output of the pulse-shaper is determined by the voltage of the capacitor connected to pin 11, which is applied directly to the output buffer.

Output buffer

The voltage of the pulse-shaper capacitor is fed to the base of the first transistor of a differential pair. To obtain a correct RC-5 code, a hysteresis circuit protects the output against spikes. The output at pin 9 is active *high*.

Q-factor killer

Figure 3 shows the Q-factor killer in the narrow-band application. In this application it is necessary to decrease the Q-factor of the input selectivity particularly when large input signals occur at pins 2 and 15. In the narrow-band application the output of the Q-factor killer can be directly coupled to the input; pin 3 to pin 2 and pin 14 to pin 15.

Input limiter

In the narrow-band application high voltage peaks can occur on the input of the selectivity circuit. The input limiter limits these voltage peaks to approximately 0,7 V. Limiting is 0,9 V max. at $I_1 = 3 \text{ mA}$.

RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

The circuit operates from a 5 V supply and has a current consumption of 2 mA. The output is a current source which can drive or suppress a current of $> 75 \mu\text{A}$ with a voltage swing of 4.5 V. The Q-killer circuit eliminates distortion of the output pulses due to the decay of the tuned input circuit at high input voltages. The input circuit is protected against signals of $> 600 \text{ mV}$ by an input limiter. The typical input is an AM signal at a frequency of 36 kHz. Figures 3 and 4 show the circuit diagrams for the application of narrow-band and wide-band receivers respectively. Circuit description of the eight sections shown in Fig. 1 are given below.

Controlled h.f. amplifier

The input signal is amplified by the gain-controlled amplifier. This circuit comprises three d.c. amplifier stages connected in cascade. The overall gain of the circuit is approximately 83 dB and the gain control range is in the order of 66 dB. Gain control is initially active in the second amplifier stage and is transferred to the first stage as limiting in the second stage occurs, thus maintaining optimum signal-to-noise ratio. Offset voltages in the d.c. coupled amplifier are minimized by two negative feedback loops; these also allow the circuit to have some series resistance of the decoupling capacitor. The output signal of the amplifier is applied to the reference amplifier and to the synchronous demodulator inputs.

Reference amplifier

The reference amplifier amplifies and limits the input signal. The voltage gain is approximately 0 dB. The output signal of this amplifier is applied to the synchronous demodulator.

Synchronous demodulator

In the synchronous demodulator the input signal and reference signal are multiplied. The demodulator output current is $25 \mu\text{A}$ peak-to-peak. The output signal of the demodulator is fed to the input of the a.g.c. detector and to the input of the pulse-shaper circuit.

A.G.C. detector

The a.g.c. detector comprises two n-p-n transistors operating as a differential pair. The top level of the output signal from the synchronous demodulator is detected by the a.g.c. circuit. Noise pulses are integrated by an internal capacitor. The output signal is amplified and applied to the first and second stages of the amplifier and to the Q-factor killer circuit.

Pulse-shaper

The pulse-shaper comprises two n-p-n transistors operating as a differential pair connected in parallel with the a.g.c. differential pair. The slicing level of the pulse shaper is lower than the slicing level of the a.g.c. detector. The output of the pulse-shaper is determined by the voltage of the capacitor connected to pin 11, which is applied directly to the output buffer.

Output buffer

The voltage of the pulse-shaper capacitor is fed to the base of the first transistor of a differential pair. To obtain a correct RC-5 code, a hysteresis circuit protects the output against spikes. The output at pin 9 is active *low*.

Q-factor killer

Figure 3 shows the Q-factor killer in the narrow-band application. In this application it is necessary to decrease the Q-factor of the input selectivity particularly when large input signals occur at pins 2 and 15. In the narrow-band application the output of the Q-factor killer can be directly coupled to the input; pin 3 to pin 2 and pin 14 to pin 15.

Input limiter

In the narrow-band application high voltage peaks can occur on the input of the selectivity circuit. The input limiter limits these voltage peaks to approximately 0,7 V. Limiting is 0,9 V max. at $I_1 = 3$ mA.

RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage (pin 8)	$V_P = V_{8-16}$	max.	13,2 V

For better sensitivity both 12 kΩ resistors may have a higher value.

SPATIAL, STEREO AND PSEUDO-STEREO SOUND CIRCUIT

The TDA3810 integrated circuit provides spatial, stereo and pseudo-stereo sound for radio and television equipment.

Features

- Three switched functions: spatial (widened stereo image)
stereo
pseudo-stereo (artificial stereo from a mono source)
- Offset compensated operational amplifiers to reduce switch noise
- LED driver outputs to facilitate indication of selected operating mode
- Start/stop circuit to reduce switch noise and to prevent LED-flicker
- TTL-compatible control inputs

TDA5040T

DC MOTOR DRIVE CIRCUIT WITH MAGNETIC-FIELD DETECTOR

GENERAL DESCRIPTION

The TDA5040T is a bipolar integrated circuit for driving brushless DC motors. It has an on-chip magnetic-field detector (Hall-element), a trigger generator circuit with control signal output, a logic control circuit and a power output stage. Most applications require three interlinked TDA5040T ICs to give full control of motor speed and direction.

Features

- On-chip magnetic-field detector
- Trigger circuit with hysteresis to eliminate instability due to magnetic feedback
- Control signal available externally
- Three-state power output for direct connection to motor field winding
- Current limiting and zener diode protection in power output stage
- Thermal protection
- 8-lead mini-pack package for surface-mounting

QUICK REFERENCE DATA

PINNING

pin	mnemonic	description
1	H_i	Hall-element input from H_o pin of other TDA5040T ICs
2	C_1	control input to define direction of motor rotation
3	GND	ground (0 V)
4	V_o	power output to motor field winding
5	V_{CC}	positive supply voltage to high power stage
6	V_P	positive supply voltage to low power stage
7	H_o	control output from Hall-element/trigger circuit
8	C_2	control input for power output active or floating

Fig. 2 Pinning diagram.

FUNCTIONAL DESCRIPTION

The Hall-element resistivity changes in the presence of an external magnetic field. Signals obtained from this effect are amplified by a differential amplifier to drive a trigger circuit. The trigger circuit has hysteresis to eliminate instability due to magnetic feedback. The output from the trigger circuit (H_O) is available externally for use as a logic input (H_i) to other TDA5040T circuits in the motor-drive system. The direction of the current at the H_O output depends on the direction of the magnetic field relative to the IC. When the north pole is above the IC and the south pole is below, the current flow is from H_O ; when the south pole is above and the north pole is below, then the current flow is into the IC.

The three-state output of the power amplifier stage is HIGH, LOW or floating, depending on the logic input signals H_i , C_1 and C_2 , and the direction of the magnetic field (see Table 1). Input C_1 defines the direction of motor rotation and input C_2 is a float command to the output circuit ($C_2 = \text{LOW} = \text{output floating}$). Both C_1 and C_2 can be driven by a TTL, CMOS or LOC MOS circuit and both have characteristics that allow up to three inputs to be driven directly by one TTL, CMOS or LOC MOS circuit (e.g. allows a common float line for the three ICs in the system).

Thermal protection is incorporated in the IC. This switches the output to the floating state when the limiting temperature is exceeded. The thermal protection has hysteresis to avoid degradation of the IC during constant short-circuiting of the output.

The power output stage includes a current limiter, and a zener diode which protects the circuit in the event of V_{CC} being disconnected when the output is inductively loaded.

TDA5708

PHOTO DIODE SIGNAL PROCESSOR FOR COMPACT DISC PLAYERS

GENERAL DESCRIPTION

The TDA5708 is a bipolar integrated circuit designed for use in compact disc players with a single spot read-out system. It amplifies the photo-diode signals and processes the error signals for the focus- and radial control network.

Features

- Data amplifier with equalizer and A.G.C.
- Offset-free pre-amplifier with A.G.C. for the servo signals
- Trackloss and drop-out detection
- Normalizing focus error output signal to minimize radial error interference
- Laser supply amplifier and reference source
- Possibility for car application
- Single and dual supply application
- TTL compatible digital input/outputs

QUICK REFERENCE DATA

Supply voltage range	V_{DD}	8 to 12 V
Quiescent supply current	I_Q	typ. 11 mA
HF input current (peak-to-peak value) for $V_{HFout(p-p)}$	$I_{HFIn(p-p)}$	typ. 8 μA
LF input current (for each diode input)	I_D	typ. 2 μA
Laser supply output current	I_{L0}	typ. 2 mA
Operating ambient temperature range	T_{amb}	-30 to +85 °C

PACKAGE OUTLINE

28-lead DIL; plastic (SOT117).

Fig. 1 Block diagram.

Fig. 2 Pinning diagram; for pin description see next page.

PIN DESCRIPTION

Pin No.	Symbol	Description
1.	DEC	Decoupling bias-current HF part.
2	V _{BB}	Negative supply connection (also substrate connection).
3	HFin	HF current input.
4	GCHF	Gain control input of HF amplifier. Current output from HF amplitude detector.
5	FE	Current output of normalized, switched focus error signal.
6	FE _{lag}	Current output of switched focus error signal, intended for lag network.
7, 8	D4, D3	LF photo diode current input.
9, 10	D1, D2	LF photo diode current input.
11	Re1	Summation of amplified currents D1 and D2.
12	Re2	Summation of amplified currents D3 and D4.
13	GCLF	Gain control input of LF amplifiers. Current output from LF amplitude detector.
14	LPF	Low pass filter for I_{ret} , used in track loss (TL) detector and LF control part ($I_{ret} = I_{Re1} + I_{Re2}$).
15	GND	Laser supply ground. Logic ground.
16	LM	Laser monitor diode input.
17	LO	Laser amplifier current output.
18	$\overline{TL}$	Track loss.
19	HFD	High frequency detector output.
20	Si	On/off control, laser supply and focus circuitry.
21	RD	Ready signal output; starting up procedure finished.
22	Beq	Bias current input for equalizer and HF input parts.
23	Bgc	Bias current input for HF output part and LF gain control, TL and FE circuitry.
24	$\overline{DODS}$	Drop out detector suppression.
25	Sc	Starting up input.
26	DET	HF detector voltage input.
27	HFout	HF amplifier and equalizer voltage output.
28	V _{DD}	Positive supply voltage.

Supplies					
Supply voltage (pin 28)	V_{DD}	8	—	12	V
Laser ground	V_{GND}	V_{BB}	—	$V_{DD} - 3$	V
Quiescent supply current	I_Q	—	11	—	mA
H.F. input (pin 3)					
D.C. voltage level	V_{HFIn}	—	1,4	—	V
Input current range (peak-to-peak value) at $f = 100\text{ kHz}$	$I_{HFIn(p-p)}$	3	—	10	μA
Input impedance	$ Z_{HFIn} $	0,5	1	2	$\text{k}\Omega$
H.F. output (pin 27)					
Output voltage at $I_{HFIn} = 0\text{ }\mu\text{A}$; $V_{GCHF} = 2,8\text{ V}$	V_{HFout}	$V_{DD} - 5$	—	$V_{DD} - 3$	V
at $I_{HFIn} = 0\text{ }\mu\text{A}$; $V_{GCHF} = 6,3\text{ V}$	V_{HFout}	—	$V_{DD} - 4,4$	—	V
Output voltage (note 1; Fig. 6) (peak-to-peak value) at $I_{HFIn(p-p)} = 6\text{ }\mu\text{A}$	$V_{O1(p-p)}$	—	1	—	V
at $I_{HFIn(p-p)} = 3\text{ to }10\text{ }\mu\text{A}$	$V_{O(p-p)}$	—	M_1	—	V
Output impedance (note 1; Fig. 6)	$ Z_{HFout} $	—	50	—	Ω
Bias input (pin 22)					
D.C. voltage level at $R_{Beq} = 12\text{ k}\Omega$	V_{Beq}	—	590	—	mV
Input current	I_{Beq}	—	-50	—	μA
Bias input (pin 23)					
D.C. voltage level at $R_{Bgc} = 24\text{ k}\Omega$	V_{Bgc}	—	1,28	—	V
Input current	I_{Bgc}	—	-50	—	μA
Decoupling output (pin 1)					
Output voltage	V_{DEC}	—	$V_{DD} - 1,5$	—	V
Output impedance	$ Z_{DEC} $	—	2	—	$\text{k}\Omega$
Level detector input (pin 26)					
D.C. voltage level	V_{DET}	—	0,82	—	V
Input current range	I_{DET}	-100	—	+ 100	μA
Input impedance	$ Z_{DET} $	—	10	—	$\text{k}\Omega$

parameter	symbol	min.	typ.	max.	unit
Reference current (HF part)					
Positive reference current (Fig. 7)	I_{refp}	—	55	—	μA
Negative reference current (Fig. 8; note 13)	I_{refn}	—	M5	—	μA
Gain control (pin 4)					
Input voltage for:					
minimum h.f. gain	V_{GCHF}	—	2,8	—	V
maximum h.f. gain	V_{GCHF}	—	6,3	—	V
Input impedance at $V_{\text{GCHF}} = 2,8$ to $6,3$ V	$ Z_{\text{GCHF}} $	—	10	—	$\text{M}\Omega$
Output current					
at $I_{\text{DET}} = 0$; $\overline{\text{DODS}} = \text{HIGH}$ or LOW	I_{GCHF}	—	—0,4	—	μA
at $I_{\text{DET}} < 0,5 I_{\text{refp}}$; $\overline{\text{DODS}} = \text{HIGH}$ or LOW	I_{GCHF}	—	—0,4	—	μA
at $I_{\text{DET}} > 0,5 I_{\text{refp}}$; $\overline{\text{DODS}} = \text{HIGH}$	I_{GCHF}	—	—4,6	—	μA
at $I_{\text{DET}} > 0,5 I_{\text{refp}}$; $\overline{\text{DODS}} = \text{LOW}$	I_{GCHF}	—	—0,4	—	μA
at $I_{\text{DET}} < I_{\text{refp}}$; $\overline{\text{DODS}} = \text{HIGH}$	I_{GCHF}	—	—4,6	—	μA
at $I_{\text{DET}} < I_{\text{refp}}$; $\overline{\text{DODS}} = \text{LOW}$	I_{GCHF}	—	—0,4	—	μA
at $I_{\text{DET}} > I_{\text{refp}}$; $\overline{\text{DODS}} = \text{LOW}$	I_{GCHF}	—	94	—	μA
at $I_{\text{DET}} > I_{\text{refp}}$; $\overline{\text{DODS}} = \text{HIGH}$	I_{GCHF}	—	94	—	μA
at $I_{\text{DET}} > 0,5 I_{\text{refn}}$; $\overline{\text{DODS}} = \text{HIGH}$ or LOW	I_{GCHF}	—	—0,4	—	μA
at $I_{\text{DET}} < 0,5 I_{\text{refn}}$; $\overline{\text{DODS}} = \text{HIGH}$	I_{GCHF}	—	—4,6	—	μA
at $I_{\text{DET}} > I_{\text{refn}}$; $\overline{\text{DODS}} = \text{HIGH}$	I_{GCHF}	—	—4,6	—	μA
at $I_{\text{DET}} < I_{\text{refn}}$; $\overline{\text{DODS}} = \text{HIGH}$	I_{GCHF}	—	94	—	μA
HFD output (pin 19)					
Output voltage LOW at $I_{\text{HFD}} = 400 \mu\text{A}$ (sink current); $I_{\text{DET}} < 0,5 I_{\text{refp}}$	V_{HFD}	—	$V_{\text{GND}} + 0,1$	$V_{\text{GND}} + 0,4$	V
Output voltage HIGH at $I_{\text{HFD}} = 50 \mu\text{A}$ (source current); $I_{\text{DET}} > 0,5 I_{\text{refp}}$	V_{HFD}	$V_{\text{GND}} + 2,4$	$V_{\text{GND}} + 9,9$	—	V
Output sink current at $I_{\text{DET}} = 0$	I_{HFD}	—	1,5	—	mA
Output source current at $I_{\text{DET}} > 0,5 I_{\text{refp}}$	I_{HFD}	—	—108	—	μA
Delay time (note 2)	τ_1, τ_2	—	15	—	μs

CHARACTERISTICS (continued)

parameter	symbol	min.	typ.	max.	unit
L.F. photo diode inputs (pins 7 to 10) (values given for each input)					
D.C. voltage level	V_D	—	1,5	—	V
Input current range	I_D	0	—	6	μA
Input impedance at 1 MHz; $I_D = 1 \mu A$	$ Z_D $	—	2	—	k Ω
Gain control (pin 13)					
Input voltage for:					
minimum l.f. gain	V_{GCLF}	—	3	—	V
maximum l.f. gain	V_{GCLF}	—	$V_{DD} - 1,5$	—	V
Input impedance	$ Z_{GCLF} $	—	4	—	M Ω
Output current (note 3)					
at $I_{DET} < 0,625 I_{refp}$	I_{GCLF}	—	$-0,1 I_{Bgc}$	—	μA
at $I_{DET} > 0,625 I_{refp}$ $I_{D1} = I_{D2} = I_{D3} = I_{D4} = 0$	I_{GCLF}	—	$-1,1 I_{Bgc}$	—	μA
at $I_{DET} > 0,625 I_{refp}$ $I_{D1} = I_{D2} = I_{D3} = I_{D4} = 1 \mu A$	I_{GCLF}	—	$M_4 - 2,1 I_{Bgc}$	—	μA
Re1, Re2 outputs (pin 11, pin 12)					
Output current (see Fig. 9)					
at $I_{D1} = I_{D2} = 0$; $I_{D3} = I_{D4} = 1 \mu A$; $V_{GCLF} = V_{DD}$	I_{Re2}	—	136	170	μA
at $I_{D1} = I_{D2} = I_{D3} = I_{D4} = 0$; $V_{GCLF} = V_{DD}$	I_{Re2}	—	0	—	μA
at $I_{D1} = I_{D2} = 1 \mu A$; $I_{D3} = I_{D4} = 0$; $V_{GCLF} = V_{DD}$	I_{Re1}	—	136	170	μA
at $I_{D1} = I_{D2} = I_{D3} = I_{D4} = 0$; $V_{GCLF} = V_{DD}$	I_{Re1}	—	0	—	μA
Output voltage					
at $V_{GCLF} = V_{DD}$; $I_{Re1} = 150 \mu A$	V_{Re1}	—	$V_{BB} + 1,4$	—	V
at $V_{GCLF} = V_{DD}$; $I_{Re2} = 150 \mu A$	V_{Re2}	—	$V_{BB} + 1,4$	—	V
Output impedance (pin 11)	$ Z_{Re1} $	—	5	—	M Ω
Output impedance (pin 12)	$ Z_{Re2} $	—	5	—	M Ω
LPF output (pin 14)					
D.C. voltage level	V_{LPF}	—	3	—	V
Input impedance	$ Z_{LPF} $	—	2	—	k Ω

parameter	symbol	min.	typ.	max.	unit
FEIag output (pin 6)					
Output voltage					
at $V_{Sc} = V_{GCLF} = V_{DD}$; $I_{FEIag} = +100 \mu A$	V_{FEIag}	—	—	$V_{BB} + 1$	V
at $V_{Sc} = V_{GCLF} = V_{DD}$; $I_{FEIag} = -100 \mu A$	V_{FEIag}	$V_{DD} - 1,5$	—	—	V
Output impedance	$ Z_{FEIag} $	—	4	—	M Ω
Output current (Fig. 10)					
at $I_{D1} = I_{D2} = I_{D3} = I_{D4} = 1 \mu A$; $V_{Sc} = V_{DD}$	I_{FEIag}	—	0	—	μA
at $I_{D1} = I_{D4} = 1 \mu A$; $I_{D2} = I_{D3} = 1 \mu A$; $V_{Sc} = V_{DD}$	I_{FEIag}	—	-130	—	μA
at $I_{D1} = I_{D4} = 1 \mu A$; $I_{D2} = I_{D3} = 2 \mu A$; $V_{Sc} = V_{BB} + 0,7 V$	I_{FEIag}	—	0	—	μA

For a.c. (note 12)					
delay time	τ ₁₁	—	tbf	—	ns

Notes to the characteristics

1. H.F. part output voltage and output impedance for closed loop conditions: $f_{HFin} = 0,1$ to 1 MHz.
 M_1 is the measured value of V_{O1} .
2. HFD delay times τ_1 and τ_2 measured as shown in Fig. 4.

Fig. 4 Delay time τ between I_{DET} and V_{HFD} .

3. $M_4 = \frac{(I_{D1} + I_{D2} + I_{D3} + I_{D4})}{2}$. M_2 ; (M_2 see note 7) with $I_{D1} = I_{D2} = I_{D3} = I_{D4} = 1 \mu A$ and $Re1$, $Re2$ connected to $1,5$ V.
4. $\overline{TL}$ delay times τ_3 , τ_4 , τ_5 and τ_6 measured as shown in Fig. 5.

Fig. 5 Delay times between I_{DET} and $V_{\overline{TL}}$.

5. Voltage output signal V_{O1} measured at $f_{HFin} = 100$ kHz; $I_{HFin(p-p)} = 3 \mu A$; $V_{GCHF} = 6,3$ V.
 Voltage output signal V_{O2} measured at $f_{HFin} = 1$ MHz; $I_{HFin(p-p)} = 3 \mu A$; $V_{GCHF} = 6,3$ V.

Notes to the characteristics (continued)

6. Phase of input/output signal, group delay and flatness measured at $I_{HFin(p-p)} = 1 \mu A$;
 $V_{GCHF} = 6,3 V$.

$$\text{Group delay: } \tau = \frac{d\phi}{d\omega}; \Delta f \approx 50 \text{ kHz.}$$

$$\text{Flatness: } \Delta\tau = \tau_{\max} - \tau_{\min}.$$

7. M_2 is the measured value of $A_1 = \left| \frac{I_{Re2}}{I_{D3} + I_{D4}} \right|$
 for $I_{D1} = I_{D2} = I_{D3} = 0$; $I_{D4} = 1 \mu A$ and $V_{GCLF} = 6,3 V$.

8. M_3 is the measured value of $A_3 = \left| \frac{I_{Re2}}{I_{D3} + I_{D4}} \right|$
 for $I_{D1} = I_{D2} = I_{D3} = 0$; $I_{D4} = 1 \mu A$ and $V_{GCLF} = 3,0 V$.

9. $P1$ is the measured value of $\frac{I_{Re1}(1)}{I_{D1}(1) + I_{D2}(1)} \cdot \frac{I_{D1}(2) + I_{D2}(2)}{I_{Re1}(2)}$

Where:

(1) are the current levels at $f_i = 25 \text{ kHz}$.

(2) are the current levels at $f_i = 1 \text{ kHz}$.

Measured taken at $V_{GCLF} = 6,3 V$.

10. $P2$ is the measured value of $\frac{I_{Re2}(1)}{I_{D3}(1) + I_{D4}(1)} \cdot \frac{I_{D3}(2) + I_{D4}(2)}{I_{Re2}(2)}$

Where:

(1) are the current levels at $f_i = 25 \text{ kHz}$.

(2) are the current levels at $f_i = 1 \text{ kHz}$.

Measured taken at $V_{GCLF} = 6,3 V$.

11. Laser supply transconductance for d.c.

$$G_{LDC} = \frac{\Delta I_{LO}}{\Delta V_{LM}} \quad (0 < -I_{LO} < 2 \text{ mA}).$$

12. Laser supply transconductance for a.c.

$$G_{LAC} = G_{LDC} \cdot \frac{1}{1 + S \cdot \tau_{11}}$$

Where: S is the laplace operator in the frequency domain.

13. M_5 is the measured value of I_{refp} .

Table 1 Test conditions for track loss output ($\overline{\text{TL}}$)

conditions	$\overline{\text{DODS}}$	inputs		output level $\overline{\text{TL}}$
		$I_{\text{D(tot)}}$	I_{DET}	
1	HIGH	$< 4,9 I_{\text{Bgc}}$	independent	HIGH
2	HIGH	$> 5,1 I_{\text{Bgc}}$	10% of I_{refp}	HIGH
3	HIGH	$> 5,1 I_{\text{Bgc}}$	30% of I_{refp}	LOW
4	HIGH	$> 5,1 I_{\text{Bgc}}$	70% of I_{refp}	HIGH
5	LOW	$< 4,9 I_{\text{Bgc}}$	independent	HIGH
6	LOW	$> 5,1 I_{\text{Bgc}}$	10% of I_{refp}	LOW
7	LOW	$> 5,1 I_{\text{Bgc}}$	30% of I_{refp}	LOW
8	LOW	$> 5,1 I_{\text{Bgc}}$	70% of I_{refp}	HIGH

Where:

$$\overline{\text{DODS}} = \text{HIGH} \quad \overline{\text{DODS}} \geq V_{\text{GND}} + 2,4 \text{ V.}$$

$$\overline{\text{DODS}} = \text{LOW} \quad \overline{\text{DODS}} \leq V_{\text{GND}} + 0,8 \text{ V.}$$

$$I_{\text{D(tot)}} = (I_{\text{D1}} + I_{\text{D2}} + I_{\text{D3}} + I_{\text{D4}}) \cdot G3 \cdot G4 \cdot G5.$$

For G3, G4, G5 see transfer functions description of TDA5708.

Table 2 Test condition for ready output (RD)

conditions	inputs		output level RD
	V_{Sc}	V_{Si}	
1	$\geq 4V_j + V_{\text{OFF}}$	HIGH	LOW
2	$\leq 4V_j - V_{\text{OFF}}$	HIGH	LOW
3	$\geq 4V_j + V_{\text{OFF}}$	LOW	HIGH
4	$\leq 4V_j - V_{\text{OFF}}$	LOW	LOW

Where:

$$V_{\text{OFF}} \approx 120 \text{ mV.}$$

 V_j is the junction voltage (0,7 V typ.).

TDA5709

RADIAL ERROR SIGNAL PROCESSOR FOR COMPACT DISC PLAYERS

GENERAL DESCRIPTION

The TDA5709 is a bipolar integrated circuit which provides control signals for the radial motor. These control signals are generated from radial error signals received from a photo-diode signal processor (TDA5708), and velocity control signals from the control processor.

Features

- Tracking error processor with automatic asymmetry control
- A.G.C. circuitry with automatic start-up and wobble generator
- Tracking control for fast forward/reverse scan, search, repeat and pause functions
- TTL compatible digital input/output
- Digitalized tracking error signal
- Possibility for car application

QUICK REFERENCE DATA

Supply voltage range	$V_{DD}-V_{BB}$	8 to 13 V
Quiescent supply current	I_Q	typ. 6 mA
Operating ambient temperature range	T_{amb}	-30 to +85 °C

PACKAGE OUTLINE

20-lead DIL; plastic (SOT146).

Fig. 1 Block diagram.

PIN DESCRIPTION

Pin No.	Symbol	Description
1	Re2	Input for amplified currents from photo diodes D1 and D2
2	C _{HPF}	High-pass filter for Re1 and Re2, used for radial offset control
3	REdig	Digital output of sign (Re2 – Re1)
4	C _{Offset}	Offset control input for radial offset
5	C _{agc}	Gain control input for radial error signal
6	V _{DD}	Positive supply voltage
7	REout	Current output of amplified (Re2 – Re1) input currents
8	RElag	Voltage output of integrated (Re2 – Re1) input currents
9	C _{lag}	Integrator capacitor for (Re1 – Re2) input currents
10	DAC	Current output for track jumping (3½ bits)
11	V _{BB}	Negative supply connection (also substrate connection)
12	B0	Input control bits for off-, catch-, play-status and DAC output current
13	B1	
14	B2	
15	B3	
16	R _{osc}	Biassing resistor for oscillator frequency and internal amplitude
17	V _{ref}	Intermediate supply voltage
18	C _{osc2}	Frequency setting capacitors for oscillator
19	C _{osc1}	
20	Re1	Input for amplified currents from photo-diodes D3 and D4

DEVELOPMENT DATA

Fig. 2 Pinning diagram.

RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltage range ($V_{DD} - V_{BB}$)

pin 6 – pin 11

 $V_{DD}-V_{BB}$ -0,3 to +13 V

Total power dissipation

 P_{tot} see Fig. 3

Storage temperature range

 T_{stg} -55 to +150 °C

Operating ambient temperature range

 T_{amb} -30 to +85 °C

Operating junction temperature

 T_j max. 150 °C**THERMAL RESISTANCE**

From junction to ambient

 $R_{th\ j-a}$ = 72 K/W

Fig. 3 Power derating curve.

CHARACTERISTICS

$V_{DD} = +5\text{ V}$; $V_{BB} = -5\text{ V}$; $T_{amb} = 25\text{ }^{\circ}\text{C}$; $V_{ref} = 0\text{ V}$; $R_{osc} = 24\text{ k}\Omega$; all voltages with respect to V_{ref} ; unless otherwise specified.

DEVELOPMENT DATA

parameter	symbol	min.	typ.	max.	unit
Supplies					
Supply voltage					
pin 6 – pin 11 ($V_{DD} - V_{BB}$)		8	—	13	V
pin 17 – pin 11 ($V_{ref} - V_{BB}$)		4,5	5,0	5,5	V
Quiescent supply current	I_Q	—	6	—	mA
REdig output (pin 3)					
Output voltage level					
HIGH (note 1; C)	V_{REdig}	$V_{ref} + 2,4$	—	—	V
LOW (note 1; A)	V_{REdig}	$V_{ref} - 0,3$	—	$V_{ref} + 0,4$	V

Where:

0 = input voltage LOW; 1 = input voltage HIGH.

* With $R_{Osc} = 24 \text{ k}\Omega$.** Non-proper operating of output REdig if the logical zero is close to V_{BB} .

FM RADIO CIRCUIT

GENERAL DESCRIPTION

The TDA7000 is a monolithic integrated circuit for mono FM portable radios, where a minimum on peripheral components is important (small dimensions and low costs).

The IC has an FLL (Frequency-Locked-Loop) system with an intermediate frequency of 70 kHz. The i.f. selectivity is obtained by active RC filters. The only function which needs alignment is the resonant circuit for the oscillator, thus selecting the reception frequency. Spurious reception is avoided by means of a mute circuit, which also eliminates too noisy input signals. Special precautions are taken to meet the radiation requirements.

The TDA7000 includes the following functions:

- R.F. input stage
- Mixer
- Local oscillator
- I.F. amplifier/limiter
- Phase demodulator
- Mute detector
- Mute switch

QUICK REFERENCE DATA

Supply voltage range (pin 5)	V_p	2,7 to 10 V
Supply current at $V_p = 4,5$ V	I_p	typ. 8 mA
R.F. input frequency range	f_{rf}	1,5 to 110 MHz
Sensitivity for -3 dB limiting (e.m.f. voltage) (source impedance: 75 Ω ; mute disabled)	EMF	typ. 1,5 μ V
Signal handling (e.m.f. voltage) (source impedance: 75 Ω)	EMF	typ. 200 mV
A.F. output voltage at $R_L = 22$ k Ω	V_o	typ. 75 mV

PACKAGE OUTLINE

18-lead DIL; plastic (SOT102).

Fig. 3 A.F. output voltage (V_O) and total harmonic distortion (THD) as a function of the e.m.f. input voltage (EMF) with a source impedance (R_S) of 75Ω : (1) muting system enabled; (2) muting system disabled.

Conditions: 0 dB = 75 mV; $f_{rf} = 96$ MHz.

for S + N curve: $\Delta f = \pm 22,5$ kHz; $f_m = 1$ kHz.

for THD curve: $\Delta f = \pm 75$ kHz; $f_m = 1$ kHz.

Notes

1. The muting system can be disabled by feeding a current of about $20 \mu A$ into pin 1.
2. The interstation noise level can be decreased by choosing a low-value capacitor at pin 3. Silent tuning can be achieved by omitting this capacitor.

FM RADIO CIRCUIT

GENERAL DESCRIPTION

The TDA7010T is a monolithic integrated circuit for mono FM portable radios, where a minimum on peripheral components is important (small dimensions and low costs).

The IC has an FLL (Frequency-Locked-Loop) system with an intermediate frequency of 70 kHz. The i.f. selectivity is obtained by active RC filters. The only function which needs alignment is the resonant circuit for the oscillator, thus selecting the reception frequency. Spurious reception is avoided by means of a mute circuit, which also eliminates too noisy input signals. Special precautions are taken to meet the radiation requirements.

The TDA7010T includes the following functions:

- R.F. input stage
- Mixer
- Local oscillator
- I.F. amplifier/limiter
- Phase demodulator
- Mute detector
- Mute switch

QUICK REFERENCE DATA

TDA7021T

FM RADIO CIRCUIT FOR MTS

GENERAL DESCRIPTION

The TDA7021T integrated radio receiver circuit is for portable radios, stereo as well as mono, where a minimum of periphery is important in terms of small dimensions and low cost. It is fully compatible for applications using the low-voltage micro tuning system (MTS). The IC has a frequency locked loop (FLL) system with an intermediate frequency of 76 kHz. The selectivity is obtained by active RC filters. The only function to be tuned is the resonant frequency of the oscillator. Interstation noise as well as noise from receiving weak signals is reduced by a correlation mute system.

Special precautions have been taken to meet local oscillator radiation requirements. Because of the low intermediate frequency, low pass filtering of the MUX signal is required to avoid noise when receiving stereo. 50 kHz roll-off compensation, needed because of the low pass characteristic of the FLL, is performed by the integrated LF amplifier. For mono application this amplifier can be used to directly drive an earphone. The field-strength detector enables field-strength dependent channel separation control.

Features

- RF input stage
- Mixer
- Local oscillator
- IF amplifier/limiter
- Frequency detector
- Mute circuit
- MTS compatible
- Loop amplifier
- Internal reference circuit
- LF amplifier for
 - mono earphone amplifier or
 - MUX filter
- Field-strength dependent channel separation control facility

Fig. 6 Stereo operation: signal/noise and channel separation of TDA7021T when used in the circuit of Fig. 8.

DEVELOPMENT DATA

Fig. 7 Stereo operation: channel separation as a function of audio frequency in the circuit of Fig. 8.

Fig. 8 Stereo application in combination with a low voltage PLL stereo decoder (TDA7040T) and a low voltage mono/stereo power amplifier (TDA7050T).

Fig. 9 Test set-up, $V_i = 30 \text{ mV}$; $f_i = 76 \text{ kHz}$; selective voltmeter at output has $R_i \geq 1 \text{ M}\Omega$ and $C_i \leq 8 \text{ pF}$, $f_o = f_i$.

Note to Fig. 9

This test set-up is to incorporate the circuit of Fig. 5 for mono operation or the circuit of Fig. 8 for stereo operation. For either circuit, replace the 100 nF capacitor at pin 6 with R6 (100 kΩ) as shown above.

Selectivity

$$S_{+300} = 20 \log \frac{V_o | (300 \text{ kHz} - f_i)}{V_o | f_i}$$

$$S_{-300} = 20 \log \frac{V_o | (300 \text{ kHz} + f_i)}{V_o | f_i}$$

LOW VOLTAGE MICRO TUNING SYSTEM (MTS)

GENERAL DESCRIPTION

The TDA7030T low voltage tuning system incorporates all analogue and digital functions necessary for complete control of a TDA7021T FM radio receiver. The tuning system coverage is precisely defined by an integrated 100 kHz crystal oscillator.

The complete low voltage radio receiver system comprises:

TDA7021T	Single-chip FM radio receiver;
TDA7030T	Low voltage micro tuning system;
TDA7040T	Low voltage stereo decoder;
TDA7050T	Low voltage stereo power amplifier.

Features

- Memory function with four presets and last-input recall
- Search tuning
- Integrating AFC
- 16-step stereo volume control
- On/off power switch driver
- On-chip interface for 16-point frequency scale LCD

PACKAGE OUTLINE

28-lead mini-pack; plastic (SO28; SOT136A).

Fig. 1 Block diagram.

Notes to Fig. 1

Prescaler first stage (divide-by-2):

input frequency 75,925 to 89,925 MHz (Japan)
 87,425 to 107,925 MHz (Europe and USA)
 sensitivity 50 mV (typical)
 input impedance (typical) 350 Ω /12 pF
 first stage turns on when radio is switched on

Prescaler second stage (divide-by-16):

switches on only for dividing

Prescaler third stage (divide-by-8):

switches on only for dividing

Multiplexer: switches the clock for the N-counter (proportional tuning)

Gate: gate time 10,24 ms (one digit = 25 kHz)

N-counter: 13-bit down-counter for tuned frequency

Freq. decoder: supplies N-counter information to the controller

Tuning current control: 1) integrating AFC (+ 1 to $-1 \mu\text{A}$ max.)
 2) search tuning (50 nA)
 3) tuning current (5 μA)
 4) down-set current ($> 100 \mu\text{A}$)

Adder and offset: allows the system to store information in 9 bits

RAM: 4 x 9-bit

Last X: last memory and search tuning counter

Limit: band limit controller

Display drivers: outputs to drive a 4 x 4 LCD matrix

Controller: controls the system

APPLICATION INFORMATION

7221280

Fig. 2 LCD matrix with waveforms showing drive for segment S1.

The circuit diagram illustrates a portable FM receiver. It begins with an antenna connected to a 10 kΩ resistor and a 68 pF capacitor. The signal is then processed by the TDA7021T IC, which includes a 10 nF capacitor and a 220 pF capacitor. The output of the TDA7021T is connected to the TDA7040T IC, which features a 68 kΩ resistor and a 270 pF capacitor. The TDA7040T's output is connected to the TDA7050T IC, which includes a 33 Ω resistor and a 47 μF capacitor. The TDA7050T's output is connected to a speaker. The circuit also includes a 3 V battery, a frequency band select switch, and a display. The TDA7021T, TDA7040T, and TDA7050T ICs are shown with their respective pin connections and internal components.

Fig. 3 System application using the TDA7030T in conjunction with the single-chip FM radio receiver (TDA7021T), low voltage stereo decoder (TDA7040T) and low voltage stereo power amplifier (TDA7050T).

DEVELOPMENT DATA

This data sheet contains advance information and specifications are subject to change without notice.

TDA7040T

LOW VOLTAGE PLL STEREO DECODER

GENERAL DESCRIPTION

The TDA7040T is a monolithic integrated circuit for low cost FM stereo radios with an absolute minimum of peripheral components and a simple lay-out.

Features

- Built-in four pole low pass filter with a 70 kHz corner frequency suppressing unwanted out-of-band input signals
- Fully integrated 228 kHz oscillator
- Pilot presence detector and soft mono/stereo blend
- Built-in interference suppression
- External stereo lamp driver applicable
- Adjustable gain

LOW VOLTAGE MONO/STEREO POWER AMPLIFIER

GENERAL DESCRIPTION

The TDA7050 is a low voltage audio amplifier for small radios with headphones (such as watch, pen and pocket radios) in mono (bridge-tied load) or stereo applications.

Features

- Limited to battery supply application only (typ. 3 and 4 V)
- Operates with supply voltage down to 1,6 V
- No external components required
- Very low quiescent current
- Fixed integrated gain of 26 dB, floating differential input
- Flexibility in use — mono BTL as well as stereo
- Small dimension of encapsulation (see package design example)

QUICK REFERENCE DATA

Supply voltage range	V_p	1,6 to 6,0 V
Total quiescent current (at $V_p = 3$ V)	I_{tot}	typ. 3,2 mA
Bridge tied load application (BTL)		
Output power at $R_L = 32 \Omega$ $V_p = 3$ V; $d_{tot} = 10\%$	P_o	typ. 140 mW
D.C. output offset voltage between the outputs	$ \Delta V $	max. 70 mV
Noise output voltage (r.m.s. value) at $f = 1$ kHz; $R_S = 5$ k Ω	$V_{no(rms)}$	typ. 140 μ V
Stereo application		
Output power at $R_L = 32 \Omega$ $d_{tot} = 10\%$; $V_p = 3$ V	P_o	typ. 35 mW
$d_{tot} = 10\%$; $V_p = 4,5$ V	P_o	typ. 75 mW
Channel separation at $R_S = 0 \Omega$; $f = 1$ kHz	α	typ. 40 dB
Noise output voltage (r.m.s. value) at $f = 1$ kHz; $R_S = 5$ k Ω	$V_{no(rms)}$	typ. 100 μ V

Fig. 1 Power derating curve.

SO PACKAGE DESIGN EXAMPLE

To achieve the small dimension of the encapsulation the SO package is preferred with only 8 pins. Because a heatsink is not applicable, the dissipation is limited by the thermal resistance of the 8-pin SO encapsulation until:

$$\frac{T_{j \max} - T_{amb}}{R_{th j-a}} = \frac{100-60}{300} = 0,1 \text{ W.}$$

CHARACTERISTICS

$V_P = 3\text{ V}$; $f = 1\text{ kHz}$; $R_L = 32\ \Omega$; $T_{\text{amb}} = 25\text{ }^\circ\text{C}$; unless otherwise specified

TDA7052

1 W BTL MONO AUDIO AMPLIFIER

GENERAL DESCRIPTION

The TDA7052 is a mono output amplifier in a 8-lead dual-in-line (DIL) plastic package. The device is designed for battery-fed portable audio applications.

Features:

- No external components
- No switch-on or switch-off clicks
- Good overall stability
- Low power consumption
- No external heatsink required
- Short-circuit proof

QUICK REFERENCE DATA

2	IN	input	6	GND2	ground (substrate)
3	GND1	ground (signal)	7	n.c.	not connected
4	n.c.	not connected	8	OUT2	output 2

FUNCTIONAL DESCRIPTION

The TDA7052 is a mono output amplifier designed for battery-fed portable audio applications, such as tape recorders and radios.

The gain is fixed internally at 40 dB. A large number of tape recorders and radios are still designed for mono sound, plus a space-saving trend by reduction of the number of battery cells. This means a decrease in supply voltage which results in an reduction of output power. To compensate for this reduction, the TDA7052 uses the Bridge-Tied-Load principle (BTL) which can deliver an output power of 1,2 W (THD = 10%) into an 8 Ω load with a power supply of 6 V. The load can be short-circuited at each signal excursion.

RATINGS

DEVELOPMENT DATA

Fig. 2 Power derating curve.

POWER DISSIPATION

Assume $V_P = 6\text{ V}$; $R_L = 8\ \Omega$; $T_{amb} = 50\ ^{\circ}\text{C}$ maximum.

The maximum sinewave dissipation is 0,9 W.

$$R_{thj-a} = \frac{150 - 50}{0,9} \approx 110\ \text{K/W}.$$

Where R_{thj-a} of the package is 110 K/W, so no external heatsink is required.

CHARACTERISTICS

$V_P = 6\text{ V}$; $R_L = 8\ \Omega$; $f = 1\text{ kHz}$; $T_{\text{amb}} = 25\text{ }^\circ\text{C}$; unless otherwise specified.

Notes to the characteristics

1. The unweighted RMS noise output voltage is measured at a bandwidth of 60 Hz to 15 kHz with a source impedance (R_S) of 5 k Ω .
2. The RMS noise output voltage is measured at a bandwidth of 5 kHz with a source impedance of 0 Ω and a frequency of 500 kHz. With a practical load ($R = 8\ \Omega$; $L = 200\ \mu\text{H}$) the noise output current is only 100 nA.
3. Ripple rejection is measured at the output with a source impedance of 0 Ω and a frequency between 100 Hz and 10 kHz. The ripple voltage = 200 mV (RMS value) is applied to the positive supply rail.

* Value to be fixed.

TDA7053

2 × 1 W PORTABLE/MAINS-FED STEREO POWER AMPLIFIER

GENERAL DESCRIPTION

The TDA7053 is an integrated class-B stereo power amplifier in a 16-lead dual-in-line (DIL) plastic package. The device, consisting of two BTL amplifiers, is primarily developed for portable audio applications but may also be used in mains-fed applications.

Features

- No external components
- No switch-ON/OFF clicks
- Good overall stability
- Low power consumption
- Short-circuit-proof

Note

The information contained within the parentheses refer to the polarity of the loudspeaker terminal to which the output must be connected.

FUNCTIONAL DESCRIPTION

The TDA7053 is a stereo output amplifier, with an internal gain of 39 dB, which is primarily for use in portable audio applications but may also be used in mains-fed applications. The current trends in portable audio application design is to reduce the number of batteries which results in a reduction of output power when using conventional output stages. The TDA7053 overcomes this problem by using the Bridge-Tied-Load (BTL) principle and is capable of delivering 1.2 W into an $8\ \Omega$ load ($V_p = 6\text{ V}$). The load can be short-circuited under all input conditions.

DEVELOPMENT DATA

RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

parameter	conditions	symbol	min.	max.	unit
Supply voltage		Vp	—	18	V
Non-repetitive peak output current		I _{OSM}	—	1.5	A
Total power dissipation		P _{tot}	see Fig. 2		
Crystal temperature		T _c	—	+ 150	°C

Channel balance		ΔG_V	—	—	1	dB
Channel separation	note 3	α	40	—	—	dB
Frequency response		f	—	0.02 to 20	—	kHz

Notes to the characteristics

1. With a practical load the total quiescent current depends on the offset voltage.
2. Ripple rejection measured at the output with $R_S = 0\ \Omega$ and $f = 100\text{ Hz}$ to 10 kHz . The ripple voltage (200 mV) is applied to the positive supply rail.
3. $R_S = 5\text{ k}\Omega$.
4. The noise output voltage (RMS value) is measured with $R_S = 5\text{ k}\Omega$, unweighted and a bandwidth of 60 Hz to 15 kHz.
5. The noise output voltage (RMS value) is measured with $R_S = 0\ \Omega$ and $f = 500\text{ kHz}$ with 5 kHz bandwidth. If $R_L = 8\ \Omega$ and $L_L = 200\ \mu\text{H}$ the noise output current is only 100 nA.

HI-FI STEREO AUDIO PROCESSOR; I²C BUS

GENERAL DESCRIPTION

The TDA8420 is a monolithic bipolar integrated stereo sound circuit with a loudspeaker channel (CH1) and a headphone channel (CH2), digital controlled via the I²C bus, for application in hi-fi audio and television sound.

Features

- Input selector
- Mode selector
- Loudspeaker channel (CH1) } with volume control, balance control and mute
- Headphone channel (CH2) }
- Pseudo stereo and spatial function
- Bass and treble control

PINNING

Fig. 2 Pinning diagram.

FUNCTIONAL DESCRIPTION

Input selector

The input to channel 1 (CH1) and channel 2 (CH2) is determined by the input selector. The selection is made from the following AF input signals:

- IN1 L (pin 26); IN1 R (pin 28)
or
- IN2 L (pin 1); IN2 R (pin 3)

Where IN1 is an internal input signal and IN2 an external input signal.

Mode selector

For each channel (CH1 and CH2) there is a mode selector which selects between stereo, sound A and sound B in the event of bilingual transmission. Both mode selectors can be controlled independently.

Headphone channel (CH2)

Volume control and balance

The stages for volume control for CH2 consist of two parts for left and right. In each part the gain can be adjusted between 0 and -62 dB in steps of 2 dB. An additional step allows an attenuation of ≥ 90 dB. Both parts can be controlled independently over the whole range, which allows the balance to be varied by controlling the volume of left and right.

Loudspeaker channel (CH1)

Volume control and balance

The loudspeaker channel (CH1) also consists of two parts for volume control (left and right). In each part the gain can be adjusted between +16 dB and -62 dB in steps of 2 dB. An additional step allows an attenuation of ≥ 90 dB. Both parts can be controlled independently over the whole range, which allows the balance to be varied by controlling the volume of left and right.

Stereo/pseudo stereo/spatial stereo mode

It is possible to select three modes. Stereo, pseudo or spatial stereo. The pseudo stereo mode receives mono transmissions and the stereo and spatial stereo mode receives stereo transmissions.

Bass control

The bass control stage can be switched from an emphasis of 15 dB to an attenuation of 12 dB for low frequencies in steps of 3 dB.

Treble control

The treble control stage can be switched from + 12 dB to -12 dB in steps of 3 dB.

Bias and power supply

The TDA8420 includes a bias and power supply stage, which generates a voltage of $\frac{1}{2} V_{CC}$ with a low output impedance and injector currents for the logic part.

Power-on reset

The on-chip power-on reset circuit sets the mute bit to active, which mutes both the loudspeaker channel (CH1) and the headphone channel (CH2). The muting can be switched by transmission of the mute bit.

I²C bus receiver and data handling**Bus specification**

The TDA8420 is controlled via the 2-wire I²C bus by a microcomputer. The two wires (SDA — serial data, SCL — serial clock) carry information between the devices connected to the bus. Both SDA and SCL are bidirectional lines, connected to a positive supply voltage via a pull up resistor. When the bus is free both lines are HIGH. The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on the SCL line is LOW. The set up and hold times are specified in AC CHARACTERISTICS.

A HIGH-to-LOW transition of the SDA line while SCL is HIGH is defined as a start condition.

A LOW-to-HIGH transition of the SDA line while SCL is HIGH is defined as a stop condition.

The bus receiver will be reset by the reception of a start condition. The bus is considered to be busy after the start condition. The bus is considered to be free again after a stop condition.

Module address

Data transmission to the TDA8420 starts with the module address MAD.

MSB					LSB			
1	0	0	0	0	0	MAD	R/W	ACK

Fig. 3 TDA8420 module address.

The module address is determined by pin 16. When connected to ground MAD = 0; when connected to V_{CC} MAD = 1. Thus two TDA8420s can be selected within a system.

Subaddress

After the module address byte a second byte is used to select the functions for both channels:

- CH1 – Volume left, volume right, bass, treble and switch functions
- CH2 – Volume left, volume right and switch functions

The subaddress SAD is stored within the TDA8420. Table 1 defines the coding of the second byte after the module address MAD.

Table 1 Second byte after module address MAD

Sequence of data transmission

After a power-on reset all eight functions have to be adjusted with eight data transmissions. It is recommended that data information for switch functions in CH1 are transmitted last because all functions have to be adjusted when the muting is switched off. The sequence of transmission of other data information is not critical.

The order of data transmission is shown in Figures 4 and 5. The number of data transmissions is unrestricted but before each data byte the module address MAD and the correct subaddress SAD is required.

Fig. 4 Data transmission after a power-on reset.

Fig. 5 Data transmission except after power-on reset.

Purchase of Philips' I²C components conveys a license under the Philips' I²C patent to use the components in the I²C-system provided the system conforms to the I²C specifications defined by Philips.

HI-FI STEREO AUDIO PROCESSOR; I²C BUS

GENERAL DESCRIPTION

The TDA8421 is a monolithic bipolar integrated stereo sound circuit with a loudspeaker channel (CH1) and a headphone channel (CH2), digital controlled via the I²C bus, for application in hi-fi audio and television sound.

Features

- Input selector
- Mode selector
- Loudspeaker channel (CH1) } with volume control, balance control and mute
- Headphone channel (CH2) }
- Pseudo stereo and spatial function
- Bass and treble control
- Electrostatic discharge protection diodes

PINNING

Fig. 2 Pinning diagram.

FUNCTIONAL DESCRIPTION

Input selector

The input to channel 1 (CH1) and channel 2 (CH2) is determined by the input selector. The selection is made from the following AF input signals:

- IN1 L (pin 26); IN1 R (pin 28)
or
- IN2 L (pin 1); IN2 R (pin 3)

Where IN1 is an internal input signal and IN2 an external input signal.

Mode selector

For each channel (CH1 and CH2) there is a mode selector which selects between stereo, sound A and sound B in the event of bilingual transmission. Both mode selectors can be controlled independently.

Headphone channel (CH2)

Volume control and balance

The stages for volume control for CH2 consist of two parts for left and right. In each part the gain can be adjusted between 0 and -62 dB in steps of 2 dB. An additional step allows an attenuation of ≥ 90 dB. Both parts can be controlled independently over the whole range, which allows the balance to be varied by controlling the volume of left and right.

Loudspeaker channel (CH1)

Volume control and balance

The loudspeaker channel (CH1) also consists of two parts for volume control (left and right). In each part the gain can be adjusted between +16 dB and -62 dB in steps of 2 dB. An additional step allows an attenuation of ≥ 90 dB. Both parts can be controlled independently over the whole range, which allows the balance to be varied by controlling the volume of left and right.

Stereo/pseudo stereo/spatial stereo mode

It is possible to select three modes. Stereo, pseudo or spatial stereo. The pseudo stereo mode receives mono transmissions and the stereo and spatial stereo mode receives stereo transmissions.

Bass control

The bass control stage can be switched from an emphasis of 15 dB to an attenuation of 12 dB for low frequencies in steps of 3 dB.

Treble control

The treble control stage can be switched from + 12 dB to -12 dB in steps of 3 dB.

Bias and power supply

The TDA8421 includes a bias and power supply stage, which generates a voltage of $\frac{1}{2} V_{CC}$ with a low output impedance and injector currents for the logic part.

Power-on reset

The on-chip power-on reset circuit sets the mute bit to active, which mutes both the loudspeaker channel (CH1) and the headphone channel (CH2). The muting can be switched by transmission of the mute bit.

I²C bus receiver and data handling**Bus specification**

The TDA8421 is controlled via the 2-wire I²C bus by a microcomputer. The two wires (SDA — serial data, SCL — serial clock) carry information between the devices connected to the bus. Both SDA and SCL are bidirectional lines, connected to a positive supply voltage via a pull up resistor. When the bus is free both lines are HIGH. The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on the SCL line is LOW. The set up and hold times are specified in AC CHARACTERISTICS.

A HIGH-to-LOW transition of the SDA line while SCL is HIGH is defined as a start condition.

A LOW-to-HIGH transition of the SDA line while SCL is HIGH is defined as a stop condition.

The bus receiver will be reset by the reception of a start condition. The bus is considered to be busy after the start condition. The bus is considered to be free again after a stop condition.

Module address

Data transmission to the TDA8421 starts with the module address MAD.

MSB						LSB		
1	0	0	0	0	0	MAD	R/W	ACK

Fig. 3 TDA8421 module address.

The module address is determined by pin 16. When connected to ground MAD = 0; when connected to V_{CC} MAD = 1. Thus two TDA8421s can be selected within a system.

Subaddress

After the module address byte a second byte is used to select the functions for both channels:

- CH1 — Volume left, volume right, bass, treble and switch functions
- CH2 — Volume left, volume right and switch functions

The subaddress SAD is stored within the TDA8421. Table 1 defines the coding of the second byte after the module address MAD.

Table 1 Second byte after module address MAD

Sequence of data transmission

After a power-on reset all eight functions have to be adjusted with eight data transmissions. It is recommended that data information for switch functions in CH1 are transmitted last because all functions have to be adjusted when the muting is switched off. The sequence of transmission of other data information is not critical.

The order of data transmission is shown in Figures 4 and 5. The number of data transmissions is unrestricted but before each data byte the module address MAD and the correct subaddress SAD is required.

Fig. 4 Data transmission after a power-on reset.

Fig. 5 Data transmission except after power-on reset.

DEVELOPMENT DATA

This data sheet contains advance information and specifications are subject to change without notice.

TDA8425

HI-FI STEREO AUDIO PROCESSOR; I²C-BUS

GENERAL DESCRIPTION

The TDA8425 is a monolithic bipolar integrated stereo sound circuit with a loudspeaker channel facility, digitally controlled via the I²C-bus for application in hi-fi audio and television sound.

Features

- Source and mode selector for two stereo channels
- Pseudo stereo, spatial stereo, linear stereo and forced mono switch
- Volume and balance control
- Bass, treble and mute control
- Power supply with power-on reset

QUICK REFERENCE DATA

parameter	symbol	min.	typ.	max.	unit

Fig. 2 Pinning diagram.

DEVELOPMENT DATA

FUNCTIONAL DESCRIPTION

Source selector

The input to channel 1 (CH1) and channel 2 (CH2) is determined by the source selector. The selection is made from the following AF input signals:

- IN1 L (pin 18); IN1 R (pin 20)
or
- IN2 L (pin 1); IN2 R (pin 3)

Mode selector

The mode selector selects between stereo, sound A and sound B (in the event of bilingual transmission) for OUT R and OUT L.

Volume control and balance

The volume control consists of two stages (left and right). In each part the gain can be adjusted between +6 dB and -64 dB in steps of 2 dB. An additional step allows an attenuation of ≥ 80 dB. Both parts can be controlled independently over the whole range, which allows the balance to be varied by controlling the volume of left and right output channels.

Linear stereo, pseudo stereo, spatial stereo and forced mono mode*

It is possible to select four modes: linear stereo, pseudo stereo, spatial stereo or forced mono. The pseudo stereo mode handles mono transmissions, the spatial stereo mode handles stereo transmissions and the forced mono can be used in the event of stereo signals.

Bass control

The bass control stage can be switched from an emphasis of 15 dB to an attenuation of 12 dB for low frequencies in steps of 3 dB.

* During forced mono mode the pseudo stereo mode cannot be used.

Treble control

The treble control stage can be switched from +12 dB to -12 dB in steps of 3 dB.

Bias and power supply

The TDA8425 includes a bias and power supply stage, which generates a voltage of $0.5 \times V_{CC}$ with a low output impedance and injector currents for the logic part.

Power-on reset

The on-chip power-on reset circuit sets the mute bit to active, which mutes both parts of the treble amplifier. The muting can be switched by transmission of the mute bit.

I²C-bus receiver and data handling**Bus specification**

The TDA8425 is controlled via the 2-wire I²C-bus by a microcomputer.

The two wires (SDA — serial data, SCL — serial clock) carry information between the devices connected to the bus. Both SDA and SCL are bidirectional lines, connected to a positive supply voltage via a pull up resistor.

When the bus is free both lines are HIGH.

The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on the SCL line is LOW. The set up and hold times are specified in AC CHARACTERISTICS.

A HIGH-to-LOW transition of the SDA line while SCL is HIGH is defined as a start condition.

A LOW-to-HIGH transition of the SDA line while SCL is HIGH is defined as a stop condition.

The bus receiver will be reset by the reception of a start condition. The bus is considered to be busy after the start condition.

The bus is considered to be free again after a stop condition.

Module address

Data transmission to the TDA8425 starts with the module address MAD.

Fig. 3 TDA8425 module address.

Subaddress

After the module address byte a second byte is used to select the following functions:

- Volume left, volume right, bass, treble and switch functions

The subaddress SAD is stored within the TDA8425. Table 1 defines the coding of the second byte after the module address MAD.

Table 1 Second byte after module address MAD

function	128	64	32	16	8	4	2	1
	MSB				LSB			
	7	6	5	4	3	2	1	0
volume left	0	0	0	0	0	0	0	0

bass	0	0	0	0	0	0	1	0
treble	0	0	0	0	0	0	1	1
switch functions	0	0	0	0	1	0	0	0
subaddress SAD								

The automatic increment feature of the slave address enables a quick slave receiver initialization, within one transmission, by the I²C-bus controller (see Fig. 5).

Definition of 3rd byte

A third byte is used to transmit data to the TDA8425. Table 2 defines the coding of the third byte after module address MAD and subaddress SAD.

Table 2 Third byte after module address MAD and subaddress SAD

DEVELOPMENT DATA

Sequence of data transmission

After a power-on reset all five functions have to be adjusted with five data transmissions. It is recommended that data information for switch functions are transmitted last because all functions have to be adjusted when the muting is switched off. The sequence of transmission of other data information is not critical.

The order of data transmission is shown in Figures 4 and 6. The number of data transmissions is unrestricted but before each data byte the module address MAD and the correct subaddress SAD is required.

Fig. 4 Data transmission after a power-on reset.

Fig. 5 Data transmission after a power-on reset with auto increment.

OCTUPLE 6-BIT DAC WITH I²C-BUS

GENERAL DESCRIPTION

The TDA8444 comprises eight digital-to-analogue converters (DACs) each controlled via the two-wire I²C-bus. The DACs are individually programmed using a 6-bit word to select an output from one of 64 voltage steps. The maximum output voltage of all DACs is set by the input $V_{\max}$ and the resolution is approximately $V_{\max}/64$. At power-on all DAC outputs are set to their lowest value. The I²C-bus slave receiver has a 7-bit address of which 3 bits are programmable via pins A0, A1 and A2.

Features

- Eight discrete DACs
- I²C-bus slave receiver
- 16-pin DIL package

FUNCTIONAL DESCRIPTION

I²C-bus

The TDA8444 I²C-bus interface is a receive-only slave. Data is accepted from the I²C-bus in the following format:

Where:

S	=	start condition	A2, A1, A0	=	programmable address bits
P	=	stop condition	I3, I2, I1, I0	=	instruction bits
A	=	acknowledge	SD, SC, SB, SA	=	subaddress bits
X	=	don't care	D5, D4, D3, D2, D1, D0	=	data bits

Fig. 3 Data format.

Address byte

Valid addresses are 40, 42, 44, 46, 48, 4A, 4C, 4E (hexadec), depending on the programming of bits A2, A1 and A0. With these addresses, up to eight TDA8444 ICs can be operated independently from one I²C-bus. No other addresses are acknowledged by the TDA8444.

Instruction and data bytes

Valid instructions are 00 to 0F and F0 to FF (hexadec); the TDA8444 will not respond to other instruction values.

Instructions 00 to 0F cause auto-incrementing of the subaddress (bits SD to SA) when more than one data byte is sent within one transmission. With auto-incrementing, the first data byte is written into the DAC addressed by bits SD to SA and then the subaddress is automatically incremented by one position for the next data byte in the series.

Auto-incrementation does not occur with instructions F0 to FF. Other than auto-incrementation there is no difference between instructions 00 to 0F and F0 to FF. When only one data byte per transmission is present, the DAC addressed by the subaddress will always receive the data.

Valid subaddresses (bits SD to SA) are 0 to 7 (hexadec) relating numerically to DAC0 to DAC7. When the auto-incrementing function is used, the subaddress will sequence through all possible values (0 to F, 0 to F, etc.).

I²C-bus

Input SCL (pin 3) and input/output SDA (pin 4) conform to I²C-bus specifications.* Pins 3 and 4 are protected against positive voltage pulses by internal zener diodes connected to the ground plane and therefore the normal bus line voltage should not exceed 5.5 V.

The address inputs A0, A1, A2 are programmed by a connection to GND for An = 0 or to Vp for An = 1. If the inputs are left floating, An = 1 will result.

FUNCTIONAL DESCRIPTION (continued)**Input $V_{\max}$**

Input $V_{\max}$ (pin 2) provides a means of compressing the output voltage swing of the DACs. The maximum DAC output voltage is restricted to approximately $V_{\max}$ while the 6-bit resolution is maintained, so giving a finer voltage resolution of smaller output swings.

Digital-to-analogue converters

Each DAC comprises a 6-bit data latch, current switches and an output driver. Current sources with values weighted by 2^0 up to 2^5 are switched according to the data input so that the sum of the selected currents gives the required analogue voltage from the output driver. The range of the output voltage is approximately 0.5 to 10.5 V when $V_{\max} = V_p$.

The DAC outputs are protected against short-circuits to V_p and GND.

To avoid the possibility of oscillations, capacitive loading at the DAC outputs should not exceed 2 nF.

RATINGS

TDA8808T
TDA8808AT

PHOTO DIODE SIGNAL PROCESSOR FOR COMPACT DISC PLAYERS

GENERAL DESCRIPTION

The TDA8808 is a bipolar integrated circuit designed for use in compact disc players with a single spot read-out system. It amplifies the photo-diode signals and processes the error signals for the focus- and radial control network.

Features

- Data amplifier with equalizer and AGC
- Offset-free pre-amplifier with AGC for the servo signals
- Trackloss and drop-out detection
- Start-up procedure for focus
- Normalizing focus error output signal to minimize radial error interference
- Laser supply amplifier and reference source
- Both TDA8808T and TDA8808AT versions suitable for car, portable and home applications
- Single and dual supply application
- Focus in-lock signal; ready signal output (RD)

PINNING

Fig. 2 Pinning diagram.

Pin functions

pin	mnemonic	description
1	GCHF	Gain control input of HF amplifier. Current output from HF amplitude detector
2	Vp	Positive supply voltage
3	HFout	HF amplifier and equalizer voltage output
4	DET	HF detector voltage input
5	Sc	Starting up capacitor input
6	Si/RD	On/off control (start input); ready signal output (starting up procedure successful)
7	Beq	Equalizer reference current input
8	Bgc	DC and LF gain control reference current input
9	FOC START	Focus normalizing circuit starting current
10	PLLH	PLL on hold output
11	TL	Track loss output
12	DODS	Drop out detector suppression input
13	V _{ext}	TDA8808T Negative supply connection for FE and FELag output stage; also substrate connection TDA8808AT Positive supply connection for FE and FELag output stage
14	LPF	Low pass filter for I _{ret} , used in track loss (TL) detector and LF gain control
15	FE	Current output of normalized, switched focus error signal
16	FELag	Current output of switched focus error signal, intended for lag network
17	LO	Laser amplifier current output
18	LM	Laser monitor diode input
19	GCLF	Gain control input for AC and LF amplifiers. Current output from LF amplitude detector
20	Re2	Summation of amplified currents from D3 and D4
21	Re1	Summation of amplified currents from D1 and D2
23, 22	D1, D2	Current inputs to DC and LF photo diode amplifier
24, 25	D3, D4	Current inputs to DC and LF photo diode amplifier
26	HFin	Current input to HF amplifier
27	GND	Ground connection of device; also substrate connection for TDA8808AT
28	DEC	Decoupling input (internal bypass)

RATINGS

Notes to the characteristics

1. Voltage output signal V_{O1} measured at $f_{HFin} = 700 \text{ kHz}$; $I_{HFin(p-p)} = 7 \mu\text{A}$; $V_{GCHF} = 2,4 \text{ V}$.
Voltage output signal V_{O2} measured at $f_{HFin} = 100 \text{ kHz}$; $I_{HFin(p-p)} = 7 \mu\text{A}$; $V_{GCHF} = 2,4 \text{ V}$.
2. Voltage output signal V_{O1} measured at $f_{HFin} = 1 \text{ MHz}$; $I_{HFin(p-p)} = 7 \mu\text{A}$; $V_{GCHF} = 2,4 \text{ V}$.
Voltage output signal V_{O2} measured at $f_{HFin} = 100 \text{ kHz}$; $I_{HFin(p-p)} = 7 \mu\text{A}$; $V_{GCHF} = 2,4 \text{ V}$.
3. Phase of input/output signal, group delay and flatness measured at $I_{HFin(p-p)} = 1 \mu\text{A}$; $V_{GCHF} = 4 \text{ V}$.

Group delay: $\tau = \frac{d\phi}{d\omega}$; $\Delta f \approx 50 \text{ kHz}$.

Flatness: $\Delta\tau = \tau_{\max} - \tau_{\min}$.

4. HF part output vptage for closed loop conditions; $f_{HFin} = 500 \text{ kHz}$.
5. HF part output voltage for closed loop conditions; $f_{HFin} = 0,1 \text{ to } 1 \text{ MHz}$.
 M_1 is the measured value of V_{O1} .

6. P_1 is the measured value of $\frac{I_{Re1} (1)}{I_{D1} (1) + I_{D2} (1)} \cdot \frac{I_{D1} (2) + I_{D2} (2)}{I_{Re1} (2)}$

Where:

(1) are the current levels at $f_i = 25 \text{ kHz}$.

(2) are the current levels at $f_i = 1 \text{ kHz}$.

Measurement taken at $V_{GCLF} = 3,5 \text{ V}$.

7. P_2 is the measured value of $\frac{I_{Re2} (1)}{I_{D3} (1) + I_{D4} (1)} \cdot \frac{I_{D3} (2) + I_{D4} (2)}{I_{Re2} (2)}$

Where:

(1) are the current levels at $f_i = 25 \text{ kHz}$.

(2) are the current levels at $f_i = 1 \text{ kHz}$.

Measurement taken at $V_{GCLF} = 3,5 \text{ V}$.

8. S_6 is the measured value of $S_1 \cdot \frac{I_{DT}}{4} - 1,1 I_{Bgc}$

Measurement taken at $V_{GCLF} = 3,5 \text{ V}$.

9. LF part reference current I_{ret} and low-pass filter output voltage for closed loop conditions.
Measurement taken at $I_{DT} > I_{DT3}$; $\Delta V_{DET} < V_{DETn2}$ or $\Delta V_{DET} > V_{DETp2}$.

10. FE output current measured at $V_{GCLF} = 3,5 \text{ V}$ and $Si/\overline{RD} = \text{HIGH Z}$; $I_{ST} = \frac{V_{FOC \text{ START}}}{R_{FOC \text{ START}}}$.

11. Laser supply transconductance for DC

$$G_{LDC} = \frac{\Delta I_{LO}}{\Delta V_{LM}} \quad (0 < -I_{LO} < 2 \text{ mA}).$$

12. Laser supply transconductance for AC

$$G_{LAC} = G_{LO} \cdot \frac{1}{1 + S \cdot \tau_{LO}}$$

Where: S is the laplace operator in the frequency domain.

TRANSFER FUNCTIONS OF THE TDA8808

GENERAL

A description of several transfer functions is given on the following pages. These transfer functions will provide application engineers with a full understanding of the operation of the integrated circuit. A number of general parameters are used to aid the explanation. Their given values are typical. Tolerance values are detailed in the TDA8808 data sheet.

General parameters

parameter	description
V_j	junction voltage, 0,7 V at $T_{amb} = 25\text{ }^{\circ}\text{C}$; temperature coefficient approximately $-2\text{ mV}/^{\circ}\text{C}$
V_T	$V_T = \frac{k \cdot T}{q} = 25,86\text{ mV at } 300\text{ K}$ where: k = Boltzmann constant T = absolute temperature q = charge of one electron
S	the Laplace operator in the frequency domain
I_{int}	internal reference current (100 μA , typ.), which has a negative temperature coefficient
I_{Bgc}	internal reference current, externally fixed by resistor R_{Bgc} . This current is temperature independent. $I_{Bgc} \approx 50\text{ }\mu\text{A}$ with $R_{Bgc} = 24\text{ k}\Omega$
I_{Beq}	internal reference current, externally fixed by resistor R_{Beq} . This current has a positive temperature coefficient $I_{Beq} \approx 50\text{ }\mu\text{A}$ with $R_{Beq} = 12\text{ k}\Omega$

Table 1 Control of switches

symbol/control	control	control
		
control = 0	open	closed
control = 1	closed	open

Voltages indicated are measured with respect to V_{GND} .

$$I_{\text{Beq}} = \frac{V_{\text{gap}} - 1 V_j}{R_{\text{Beq}}} \approx \frac{1,2 \text{ V} - V_j}{R_{\text{Beq}}} \quad \text{at } R_{\text{Beq}} = 12 \text{ k}\Omega \quad (I_{\text{Beq}} \approx 50 \mu\text{A})$$

HF part

Fig. 2 Block diagram; HF amplifier.

The transfer function from HFIn (pin 26) to HFOut (pin 3) with V_{GCHF} as parameter is given by:

$$\frac{V_O}{I_{HFIn}} = G_1 \cdot G_2 \text{ (V/A)}$$

Where:

$$G_1 = R_T \cdot \left(\frac{V_{GCHF} - 3 V_j}{4 \cdot R_{504} \cdot \frac{V_{gap}}{R_{922}}} \right) \text{ with: } 0 \leq \frac{V_{GCHF} - 3 V_j}{4 \cdot R_{504} \cdot \frac{V_{gap}}{R_{922}}} \leq 1$$

$$G_2 = \frac{1 - 4 (S/\omega_0)^2}{1 + 1,45 (S/\omega_0) + (S/\omega_0)^2} \cdot \frac{1}{1 + S \cdot R_S \cdot C_p}$$

R_{504} = integrated resistor 3,5 k Ω (typ.).

R_T = transfer resistance 480 k Ω (typ.).

V_{GCHF} = gain control voltage; active range 1,8 to 3,4 V.

$$\omega_0 = 1,02 \cdot 10^{11} \times \frac{1}{R_{Beq}} \text{ (rad/s).}$$

R_{Beq} = external resistor (12 k Ω ; typ.) connected to pin Beq.

R_S = external resistor (1 k $\Omega \pm 2\%$) connected to pin HFOut.

C_p = external capacitor (100 pF $\pm 2\%$) connected to pin HFOut via R_S . R_S and C_p are typical applications.

R_{559} = integrated resistor 1055 Ω (typ.).

R_{587} = integrated resistor 632 Ω (typ.).

R_{615} = integrated resistor 6749 Ω (typ.).

R_{650} = integrated resistor 564 Ω (typ.).

HF level detector

The HF level detector comprises three temperature compensated rectifier comparators.

Fig. 3 Block diagram; HF level detector.

Transfer functions:

$$|HFL \text{ trigger level}| = \frac{9 \text{ k} + R_O}{R_{559} + R_{587}} \cdot 0,058 \text{ V} = 0,625 V_{ref}$$

$$|DO \text{ trigger level}| = \frac{9 \text{ k} + R_O}{R_{559} + R_{587} + R_{615}} \cdot 0,058 \text{ V} = 0,125 V_{ref}$$

The transfer functions from V_{DET} to DO and HFL as a function of time are given in Fig. 4.

Fig. 4 Timing relation; HF level detector.

HF AGC

The transfer function from V_{HF} to I_{GCHF} is shown in Fig. 5.

Fig. 5 I_{GCHF} as a function of V_{DET} .

HF AGC (continued)

When the HF AGC loop is closed i.e. pin GCHF connected to GND via a capacitor and pin HF out connected to pin DET via a capacitor, a fully integrated first order loop is obtained. In this situation the amplitude of the HF output signal is temperature compensated. In this condition the HF amplitude is regulated to:

$$|V_{HF(max)}| = \frac{9 k + R_O}{R_{559}} \cdot 0,058 \text{ V} = V_{ref}$$

Input impedance of HF gain control input

$$|Z_{GCHF}| \approx 25 \text{ M}\Omega.$$

Fig. 6 GCHF equivalent input circuit.

Transfer function from (D1 + D2) input to Re1 output

The current gain from the (D1 + D2) input to the Re1 output is equal to the current gain from the (D3 + D4) input to the Re2 output.

Fig. 7 Block diagram; (D1 + D2) input to Re1 output.

The transfer function is given by:

$$\frac{I_{Re1}}{I_{D1} + I_{D2}} = \frac{I_{Re2}}{I_{D3} + I_{D4}} = G3 \cdot G4$$

Where:

$$G3 = k_1 \cdot \frac{V_{GCLF} - 2V_j}{3 \cdot R_{171} \cdot \frac{V_{gap}}{R_{922}}} \text{ with } 0 < \frac{V_{GCLF} - 2V_j}{3 \cdot R_{171} \cdot \frac{V_{gap}}{R_{922}}} \leq 1$$

$$G4 = \frac{1}{1 + (S/\omega_1)}$$

k_1 = fixed, typical 64 times.

V_{GCLF} = gain control voltage for LF amplifier, $1 \text{ V} \leq V_{GCLF} \leq 2,8 \text{ V}$; active range.

R_{171} = integrated resistor $4 \text{ k}\Omega$ (typ.).

ω_1 = $157 \cdot 10^3$ radians per second (fixed).

When the LF AGC loop is closed i.e. pin GCLF connected to GND via a capacitor, a fully integrated first order loop is obtained.

Low pass filter (LPF; pin 14)

Fig. 8 Low pass filter (LPF); equivalent circuit.

Where:

$$(I_{D1} + I_{D2} + I_{D3} + I_{D4}) \cdot G3 \cdot G4 - 2 I_{Bgc} \geq 0$$

$$G5 = \frac{1}{1 + S/\omega_2}$$

$$\omega_2 = \frac{1}{Z_{LPF} \cdot C_{LPF}}$$

$$Z_{LPF} \approx 3 \text{ k}\Omega$$

DEVELOPMENT DATA

Transfer:

$$\frac{\left\{ \begin{array}{l} \overline{\text{TL}} \\ \text{PLLH} \\ \text{VHF} \\ \text{LF AGC} \end{array} \right\}}{\left\{ \begin{array}{l} \text{ID1} \dots \text{ID4} \\ \text{DODS} \end{array} \right\}} \longrightarrow$$

Fig. 9 Transfer function from $(\text{ID1} + \text{ID2} + \text{ID3} + \text{ID4})$ to the gain control low frequency input (GCLF) with IDET as parameter.

Table 2 Transfer function from $(I_{D1} + I_{D2} + I_{D3} + I_{D4})$ to GCLF with I_{DET} as parameter

DET input	low frequency input signal	GCLF output	LF AGC loop
$ V_{HF} < 5/8 V_{ref}$		$I_{GCLF} = -0,2 I_{Bgc}$	open
$ V_{HF} > 5/8 V_{ref}$	$(I_{D1} + I_{D2} + I_{D3} + I_{D4}) \cdot G3 \cdot G4 < 2 \cdot I_{Bgc}$	$I_{GCLF} = -0,6 I_{Bgc}$	open
$ V_{HF} > 5/8 V_{ref}$	$(I_{D1} + I_{D2} + I_{D3} + I_{D4}) \cdot G3 \cdot G4 > 2 \cdot I_{Bgc}$	$I_{GCLF} = -I^{(1)}$	closed

Where:

$$(1) I = \left(\frac{(I_{D1} + I_{D2} + I_{D3} + I_{D4}) \cdot G3 \cdot G4 - 2I_{Bgc}}{4} \right) \cdot G5 - 0,6 I_{Bgc}$$

$$G3 = k_1 \cdot \frac{V_{GCLF} - 2 V_j}{3 \cdot R_{171} \cdot \frac{V_{gap}}{R_{g22}}} \text{ with } 0 < \frac{V_{GCLF} - 2 V_j}{3 \cdot R_{171} \cdot \frac{V_{gap}}{R_{g22}}} \leq 1$$

$$G4 = \frac{1}{1 + (S/\omega_1)}$$

$$G5 = \frac{1}{1 + (S/\omega_2)}$$

k_1 = fixed, typical 64 times

With LF AGC loop closed:

$(I_{D1} + I_{D2} + I_{D3} + I_{D4}) \cdot G3 \cdot G4 \cdot G5$ is regulated to (cfr on track) $4,4 I_{Bgc}$.

The influence of the delay circuits on the transfer function; $(I_{D1} + I_{D2} + I_{D3} + I_{D4})$ to GCLF is shown in Fig. 10.

Test condition: $(I_{D1} + I_{D2} + I_{D3} + I_{D4}) \cdot G3 \cdot G4 < 2 \cdot I_{Bgc}$.

Fig. 10 Delay times between I_{DET} and I_{GCLF} .

Transfer function $\overline{TL}$, $\overline{PLLH}$ outputs with V_{HF} , I_{D1} , I_{D2} , I_{D3} and I_{D4} as variables with V_{GCLF} and $\overline{DODS}$ as parameters (see Fig. 9).

Transfer function $\overline{TL}$

$\overline{DODS} = \text{HIGH}$

$\overline{TL} = 0$ (approximately GND) if;
 $1/8 V_{ref} < |V_{HF}| < 5/8 V_{ref}$
 and
 $(I_{D1} + I_{D2} + I_{D3} + I_{D4}) \cdot G3 \cdot G4 \cdot G5 > 5 \cdot I_{Bgc}$.

$\overline{DODS} = \text{LOW}$

$\overline{TL} = 0$ if;
 $|V_{HF}| < 5/8 V_{ref}$
 and
 $(I_{D1} + I_{D2} + I_{D3} + I_{D4}) \cdot G3 \cdot G4 \cdot G5 > 5 \cdot I_{Bgc}$.

Transfer function $\overline{PLLH}$

$\overline{PLLH} = 0$ if;
 $|V_{HF}| < 5/8 V_{ref}$
 or
 $|V_{HF}| < 5/8 V_{ref}$ and $G5 \frac{(I_{D1} + I_{D2} + I_{D3} + I_{D4}) \cdot G3 \cdot G4 - 2I_{Bgc}}{2} < 0,33I_{Bgc}$

Input impedance of the LF gain control input

$|Z_{GCLF}| \approx 25 \text{ M}\Omega$.

Fig. 11 GCLF equivalent input circuit.

Transfer function from diode inputs D1, D2, D3, D4 and voltage input V_{Sc} to outputs FE and FElag

Fig. 12 Block diagram; photo diode inputs to FE and FElag outputs.

The transfer function from I_{D1} , I_{D2} , I_{D3} , I_{D4} to FElag output with V_{Sc} as parameter is given by the following formula (see also Fig. 14).

$$I_{FElag} = G3 \cdot G4 \cdot \frac{1 + \tanh \left(\frac{V_{Sc} - 3 V_j}{2V_T} \right)}{22} \cdot [(I_{D1} + I_{D4}) - (I_{D2} + I_{D3})]$$

Note

Since $\tanh \frac{V_{Sc} - 3 V_j}{2V_T} \approx -1$ for $V_{Sc} - 3 V_j \leq -150 \text{ mV}$

and $\tanh \frac{V_{Sc} - 3 V_j}{2V_T} \approx +1$ for $V_{Sc} - 3 V_j \geq +150 \text{ mV}$

this means

$FElag = 0$ for $V_{Sc} - 3 V_j \leq -150 \text{ mV}$ and

$FElag = G3 \cdot G4 \cdot \{ (I_{D1} + I_{D4}) - (I_{D2} + I_{D3}) \}$ for $V_{Sc} - 3 V_j \geq 150 \text{ mV}$

In practice we see a smooth take over from $FElag = 0$ to $FElag$ (nominal value) with respect to the voltage V_{Sc} .

Remark:

$Si/\overline{RD}$ not forced LOW.

The transfer function from I_{D1} , I_{D2} , I_{D3} , I_{D4} to FE output with V_{Sc} as parameter is given by the following formula (see also Fig. 14).

$$\begin{aligned}
 I_{FE} = I_{start} \cdot & \left[\tan h \left(\frac{V_{Sc} - 1 V_j + \frac{I_{start} (R_{439} - R_{440})}{2}}{2 V_T + \frac{I_{start} (R_{439} + R_{440})}{2}} \right) + \right. \\
 & \left. \frac{1}{2} + \frac{1}{2} \tan h \left(\frac{V_{Sc} - 3 V_j - I_{int} \cdot R_{448}}{2 V_T} \right) \right] + \\
 I_{control} & \left[\frac{(I_{D1} - \frac{I_{D2}}{2}) \tan h \left(\frac{V_{Sc} - 2 V_j}{2 V_T} \right) - \frac{I_{D2}}{2}}{I_{D1} + I_{D2}} + \right. \\
 & \text{----- normalized current -----} \\
 & \left. \frac{(I_{D4} - \frac{I_{D3}}{2}) \tan h \left(\frac{V_{Sc} - 2 V_j}{2 V_T} \right) - \frac{I_{D3}}{2}}{I_{D3} + I_{D4}} \right] + \\
 & \text{----- normalized current -----} \\
 G3 \cdot G4 \cdot \frac{1}{2} \cdot & \left[\tan h \left(\frac{V_{Sc} - 3 V_j}{2 V_T} \right) - 1 \right] \cdot (I_{D2} + I_{D3}) \\
 & \text{----- not normalized current -----}
 \end{aligned}$$

which means if:

$$0 < V_{Sc} < 1 V_j - 250 \text{ mV} \rightarrow I_{FE} = -I_{start} - I_{control} \left(\frac{I_{D1}}{I_{D1} + I_{D2}} + \frac{I_{D4}}{I_{D3} + I_{D4}} \right)$$

$$-G3 \cdot G4 \cdot (I_{D2} + I_{D3})$$

$$\begin{aligned}
 1 V_j + 250 \text{ mV} < V_{Sc} < 2 V_j - 100 \text{ mV} \rightarrow I_{FE} \\
 = I_{start} - I_{control} \left(\frac{I_{D1}}{I_{D1} + I_{D2}} + \frac{I_{D4}}{I_{D3} + I_{D4}} \right)
 \end{aligned}$$

$$-G3 \cdot G4 \cdot (I_{D2} + I_{D3})$$

$$\begin{aligned}
 2 V_j + 100 \text{ mV} < V_{Sc} < 3 V_j - 100 \text{ mV} \rightarrow I_{FE} \\
 = I_{start} - I_{control} \left(\frac{I_{D1} - I_{D2}}{I_{D1} + I_{D2}} + \frac{I_{D4} - I_{D3}}{I_{D3} + I_{D4}} \right)
 \end{aligned}$$

$$-G3 \cdot G4 \cdot (I_{D2} + I_{D3})$$

$$V_{Sc} > 3 V_j - 100 \text{ mV} \rightarrow I_{FE} = I_{\text{control}} \left(\frac{I_{D1} - I_{D2}}{I_{D1} + I_{D2}} + \frac{I_{D4} - I_{D3}}{I_{D3} + I_{D4}} \right)$$

Where:

I_{start} (focus start current) is related to R_{FS} (resistor determining the focus start current). The relationship is shown by the following formula:

$$R_{FS} = \frac{V_T}{I_{\text{start}}} \ln \frac{V_{\text{gap}}}{R_{922} I_{\text{start}}} + \frac{R_{444} \cdot V_{\text{gap}}}{I_{\text{start}}} \approx \frac{0,56 \text{ V}}{I_{\text{start}}}$$

R_{439} = integrated resistor 700Ω (typ.).

R_{440} = integrated resistor 300Ω (typ.).

R_{444} = integrated resistor $5,5 \text{ k}\Omega$ (typ.).

R_{448} = integrated resistor $4,0 \text{ k}\Omega$ (typ.).

R_{922} = integrated resistor $12 \text{ k}\Omega$ (typ.).

$$\Sigma = \frac{V_{\text{gap}}}{R_{922}} \cdot R_{448} = I_{\text{int}} \cdot R_{448} \approx 0,4 \text{ V.}$$

$$I_{\text{control}} = (I_{D1} + I_{D2} + I_{D3} + I_{D4}) \cdot G3 \cdot G4 \text{ for} \\ (I_{D1} + I_{D2} + I_{D3} + I_{D4}) \cdot G3 \cdot G4 \leq 2 \cdot I_{Bgc} \\ \text{otherwise } I_{\text{control}} = 2 \cdot I_{Bgc} \text{ (see also Fig. 13).}$$

DEVELOPMENT DATA

Fig. 13 I_{control} as a function of $\overline{I_{\text{tot}}}$.

$$\overline{I_{\text{tot}}} = (I_{D1} + I_{D2} + I_{D3} + I_{D4}) \cdot G3 \cdot G4.$$

Remark:

Si/ $\overline{RD}$ = not forced LOW

Where:

- LF amplifier gain = 64
- $I_D = 1 \mu A$
- $I_{start} = 110 \mu A$
- _____ = I_{start}
- — — — — = $(I_{D1} + I_{D4})$ normalized current
- · — · — · — = $(I_{D2} + I_{D3})$ normalized current
- · · — · · — = $(I_{D1} + I_{D4}) \cdot G3 \cdot G4$ not normalized current
- - - - - = $(I_{D2} + I_{D3}) \cdot G3 \cdot G4$ not normalized current

7221467

Fig. 14 I_{FE} , I_{FElag} and $Si/\overline{RD}$ as a function of V_{Sc} (asymtotes shown).

Fig. 15 Transfer function from $Si/\overline{RD}$ to V_{Sc} and V_{GCLF} .

The condition $V_{GCLF} \leq \frac{3 V_{gap}}{R_{922}} \cdot R_{171} + 2 V_j$ is fulfilled (from a system point of view)

if:

$$|V_{DET}| \geq 0,625 V_{ref} \text{ and } (I_{D1} + I_{D2} + I_{D3} + I_{D4}) \cdot k_1 - 2I_{Bgc} \geq 2,4I_{Bgc}$$

This means that:

- Si/ $\overline{RD}$ will only go LOW (ready = true) if the LF AGC is in its active range
- HF must be present; motor must be running

Between $V_{Sc} = 2 V_j$ and $V_{Sc} = 4 V_j + 200 \text{ mV}$ the Si/ $\overline{RD}$ line is not monitored by the IC.

This means that stopping the start procedure is impossible within this range.

Fig. 16 Si/ $\overline{RD}$ signal as a function of V_{Sc} and time.

Transfer function laser supply

Fig. 17 Block diagram; laser supply.

Laser supply transconductance for DC

$$G_{LDC} = \frac{\Delta I_{LO}}{\Delta V_{LM}} \quad (0 < -I_{LO} < 2 \text{ mA}) \approx 0,5 \text{ A/V.}$$

Laser supply transconductance for AC

$$G_{LAC} = G_{LDC} \cdot \frac{1}{1 + s\tau_{11}}$$

Where:

τ_{11} = fixed with external compensation capacitor (C_{comp})

$$\tau_{11} = (Z_{LO} // Z_{pi}) \cdot C_{comp}$$

Where:

Z_{LO} = laser amplifier output impedance $\approx 95 \text{ k}\Omega$

Z_{pi} = power stage input impedance

Fig. 18 Laser amplifier output circuitry.

TDA8809T

RADIAL ERROR SIGNAL PROCESSOR FOR COMPACT DISC PLAYERS

GENERAL DESCRIPTION

The TDA8809T is a bipolar integrated circuit which provides control signals for the radial motor. These control signals are generated from radial error signals received from a photo-diode signal processor (TDA8808), and velocity control signals from the control processor.

Features

- Tracking error processor with automatic asymmetry control
- AGC circuitry with automatic start-up and wobble generator
- Tracking control for fast forward/reverse scan, search, repeat and pause functions
- Radial polarity - 4 - tracks counting
- Possibility for car, home and portable applications

QUICK REFERENCE DATA

PINNING

Fig. 2 Pinning diagram.

Pin functions

pin	mnemonic	description
1	Vp	Positive supply voltage
2	Cosc1	Frequency setting capacitors for oscillator
3	Cosc2	
4	Rwob	Wobble generator input
5	Rosc	Biassing resistor for oscillator frequency and internal amplitude
6	$\overline{\text{DIV4}}$	Divide-by-4 input
7	REdig	Digital output of sign (Re2 - Re1)
8	B3	Input control bits for off-, catch-, play-status and DAC output current
9	B2	
10	B1	
11	B0	
12	Vext(+)	Positive external voltage input
13	Vext(-)	Negative external voltage input (also substrate connection)
14	GND	Negative supply connection
15	RADout	Current output of amplified (Re2 - Re1) input currents
16	REin	Radial error input
17	RElag	Voltage output of integrated (Re2 - Re1) input currents
18	Lag	Connection of integrator capacitor for (Re1 - Re2) input currents
19	Lead	Lead output
20	Vref	Internal reference voltage output
21	AGC	Gain control input for radial error signal
22	RDAC	Biassing resistor for current output for track jumping (3½ bits)
23	offset in	Offset control input for radial offset
24	offset out	Offset control output for radial offset
25	CLPF	Low-pass filter for Re1 and Re2, used for radial offset control
26	CHPF	High-pass filter for Re1 and Re2, used for radial offset control
27	Re1	Input for amplified currents from photo-diodes D1 and D2
28	Re2	Input for amplified currents from photo diodes D3 and D4

TRANSFER FUNCTIONS OF THE TDA8809

GENERAL

A description of several transfer functions is given on the following pages. These transfer functions will provide application engineers with a full understanding of the operation of the integrated circuit. A number of general parameters are used to aid the explanation. Their given values are typical. Tolerance values are detailed in the TDA8809 data sheet.

General parameters

parameter	description
V_j	junction voltage, 0,7 V at $T_{amb} = 25\text{ }^{\circ}\text{C}$; temperature coefficient approximately $-2\text{ mV}/^{\circ}\text{C}$
V_T	$V_T = \frac{k \cdot T}{q} = 25,86\text{ mV at } 300\text{ K}$ where: k = Boltzman constant T = absolute temperature q = charge of one electron
I_{int}	internal reference current (100 μA , typ.), which has a negative temperature coefficient $I_{int} = \frac{V_{gap}}{R_{12}}$
I_{osc}	internal reference current (50 μA , typ.), externally fixed by resistor R_{osc} This current is temperature independent
I_1	internal reference current (50 μA , typ.) This current is temperature independent
V_{ref}	internal reference voltage source This voltage is equal to $2 \times V_{gap}$ (2,4 V, typ.)
V_{gap}	internal reference voltage source (1,2 V, typ.) This voltage is temperature independent

Reference currents (I_{int} , I_{osc})

Reference voltages (V_{gap} , V_{ref})

Fig. 1 Block diagram; reference currents I_{int} , I_{osc} ; reference voltages V_{gap} , V_{ref} .

Where:

Voltage reference level = $V = 1,2 \text{ V}$

$$I_{int} = \frac{V_{gap}}{R_{12}} \approx \frac{1,2 \text{ V}}{R_{12}} \quad \text{at } R_{12} \approx 12 \text{ k}\Omega \quad (I_{int} \approx 100 \mu\text{A})$$

$$I_{osc} = \frac{1,2 \text{ V}}{R_{osc}} \quad \text{at } R_{osc} \approx 24 \text{ k}\Omega \quad (I_{osc} \approx 50 \mu\text{A})$$

$$V_{ref} = \left(1 + \frac{R_{277}}{R_{278}}\right) \times V_{gap} \quad \text{at } R_{277} \approx R_{278} \quad (V_{ref} = 2 \cdot V_{gap})$$

Note

The value of R_{osc} determines the transconductance of the oscillator.

Transfer function of $(I_{Re1} + I_{Re2})$ to V_{LPF} and I_{HPF} Fig. 2 Block diagram; $(I_{Re1} + I_{Re2})$ to V_{LPF} and I_{HPF} .

$$V_{LPF} = V_{DD} + (I_{Re1} + I_{Re2}) R_{617} \frac{1}{1 + j \frac{\omega}{\omega_L}}$$

$$I_{HPF} = - \frac{V_{LPF}}{R_{621}} \frac{j \frac{\omega}{\omega_H}}{1 + j \frac{\omega}{\omega_H}} \Rightarrow I_{HPF} = - (I_{Re1} + I_{Re2}) \frac{1}{1 + j \frac{\omega}{\omega_L}} \cdot \frac{j \frac{\omega}{\omega_H}}{1 + j \frac{\omega}{\omega_H}} \cdot \frac{R_{617}}{R_{621}}$$

While $R_{617} \approx R_{621} \Rightarrow$

$$I_{HPF} = - (I_{Re1} + I_{Re2}) \frac{1}{1 + j \frac{\omega}{\omega_L}} \cdot \frac{j \frac{\omega}{\omega_H}}{1 + j \frac{\omega}{\omega_H}}$$

Where:

$$\omega_L = \frac{1}{C_{LPF} \cdot R_{617}}$$

$$\omega_H = \frac{1}{C_{HPF} \cdot R_{621}}$$

 R_{621} = integrated resistor 8 k Ω (typ.) R_{617} = integrated resistor 8 k Ω (typ.)

Transfer function of I_{Re1} , I_{Re2} to $REdig$ with V_{offset} and digital inputs as parameters

See also block diagram Fig. 4.

Table 1 State of the $REdig$ output set by conditions of I_{Re1} and R_{Re2}

condition	$REdig$ output
$I_{Re1} \cdot (1 + \frac{\alpha}{2}) > I_{Re2} \cdot (1 - \frac{\alpha}{2})$	LOW
$I_{Re1} \cdot (1 + \frac{\alpha}{2}) < I_{Re2} \cdot (1 - \frac{\alpha}{2})$	HIGH

with:

$$\alpha = \frac{V_{offset} - V_{ref}}{R_B \cdot I_{int}/2}; R_B \cdot I_{int}/2 = (R_{619} + R_{620}) \frac{V_{gap}}{2 \cdot R_{12}} = 0,6 \text{ V}$$

$$-1 \leq \alpha \leq 1$$

Transfer function of B0, B1, B2, B3 and REin inputs to RADout output

Table 2 Truth table for RADout output current

functions	RADout output	logical inputs				internal switches		
		B3	B2	B1	B0	lag s/c	rad	lag hold
KICK-PUSH	$-I_{DAC}$	0	0	0	0	off	off	on*
	$-4 \cdot I_{DAC}$	0	0	0	1	off	off	off*

PLAY	$-I_{REin}$	0	1	1	1	off	on	off
PUSH	$-I_{DAC}$	1	0	0	0	on	off	on*
PUSH	$-3/4 I_{DAC}$	1	0	0	1	on	off	off*
PUSH	$-1/2 I_{DAC}$	1	0	1	0	on	off	on*
PUSH	$-1/4 I_{DAC}$	1	0	1	1	on	off	off*
PULL	I_{DAC}	1	1	0	0	on	off	on*
PULL	$3/4 I_{DAC}$	1	1	0	1	on	off	off*
PULL	$1/2 I_{DAC}$	1	1	1	0	on	off	on*
PULL	$1/4 I_{DAC}$	1	1	1	1	on	off	off*

DEVELOPMENT DATA

Where:

0 = input voltage LOW; 1 = input voltage HIGH.

* = not functional.

$$I_{DAC} = \frac{1}{2} \frac{V_{gap}}{R_{DAC}} = \frac{0,6 \text{ V}}{R_{DAC}} \text{ typ.}$$

 $Z_{REin} \rightarrow 0$; voltage V_{ref} $Z_{RADout} \rightarrow \infty$; voltage between V_{ext+} and V_{ext-} (minus saturation drop).

Transfer function of C_{osc1} , C_{osc2} and R_{osc} to the generated wobble frequency

Fig. 3 Block diagram; C_{osc1} , C_{osc2} and R_{osc} to the generated wobble frequency.

$$0^\circ = A \cdot \sin \omega_0 t$$

$$-45^\circ = A \cdot \sqrt{2} \cdot \sin (-45^\circ + \omega_0 t)$$

$$-90^\circ = -A \cos \omega_0 t$$

Where:

$$\omega_0 = \frac{\alpha}{R_{osc} \sqrt{C_{osc1} \cdot C_{osc2}}};$$

$$\alpha = \frac{R_{206} + R_{207}}{R_{206} + R_{207} + re(50 \mu A)} \cdot \sqrt{\frac{R_{12}}{R_{206} + R_{207}} \frac{R_{12}}{R_{306} + R_{307}}}$$

$$A = \frac{\sqrt{1/2}}{\alpha} V_{gap} = 0,6 \text{ V}$$

$$R_{12} = 3 \times 4 \text{ k}\Omega; \text{ typ. } R_{206} = R_{207} = R_{306} = R_{307} = 4 \text{ k}\Omega \text{ typ.}; re(50 \mu A) = 500 \Omega$$

Calculation of R_{wob} :

$$\hat{I}_{IN} = \frac{\hat{V}_{osc1} - V_{ref}}{A} \sqrt{\frac{1}{2}} - I_{wob} \Rightarrow I_{wob} = \frac{\hat{I}_{IN}}{\sqrt{\frac{1}{2}}} \frac{A}{\hat{V}_{osc1} - V_{ref}} \Rightarrow I_{wob} = \sqrt{2} \cdot \hat{I}_{IN}$$

$$R_{wob} = \frac{R_{120} - \frac{V_T}{I_{osc}} \ln \frac{I_{wob}}{I_{osc}}}{\frac{I_{wob}}{I_{osc}}} \Rightarrow$$

$$R_{wob} = \frac{2 \text{ k}\Omega - 500 \Omega \cdot \ln \frac{I_{wob}}{50 \mu A}}{\frac{I_{wob}}{50 \mu A}} \text{ typ. with } I_{wob} = \sqrt{2} \cdot \hat{I}_{IN}$$

DEVELOPMENT DATA

Transfer functions of inputs Re1 and Re2 to output V_{offset} with V_{agc} and R_{osc} as parameters

I.F. LIMITING AMPLIFIER, FM DETECTOR AND AUDIO AMPLIFIER

GENERAL DESCRIPTION

The TDB1080 is a bipolar integrated circuit comprising a limiting amplifier, a balanced FM detector and a class-B audio amplifier. It is intended for frequencies up to 500 kHz with either narrow-band or wide-band FM. The circuit is especially suited for use in portophone sets, where a low supply voltage, a low supply current and a high sensitivity are of paramount importance.

QUICK REFERENCE DATA

Supply voltage range		
I.F. part	V_{CC1}	2,3 to 3,5 V
A.F. part	V_{CC2}	2,3 to 10 V
Supply current at $V_{CC1} = V_{CC2} = 2,5$ V, no signal	$I_{CC1} + I_{CC2}$	typ. 3 mA
Input voltage at onset of limiting	$V_{Ilim(rms)}$	typ. 30 μ V
AM rejection at $V_i = 1$ mV	k_{AMR}	typ. 50 dB
Open-loop voltage amplification of audio amplifier	A_{vd}	typ. 200
Output power of audio amplifier at $V_{CC2} = 9$ V	P_o	typ. 65 mW
Operating ambient temperature range	T_{amb}	-20 to + 70 °C

PACKAGE OUTLINES

TDB1080: 16-lead DIL; plastic (SOT38WBE).

TDB1080T: 16-lead mini-pack; plastic (SO16; SOT109A).

Fig. 1 Circuit diagram.

15	QA	audio amplifier output
16	V _{CC2}	positive supply, audio amplifier

Fig. 2 Pinning diagram.

FUNCTIONAL DESCRIPTION

The TDB1080 consists of two parts that may be used independently, viz. a limiting i.f. amplifier with balanced FM detector, and a class-B audio amplifier.

Supply

The two parts of the circuit have a common-ground pin V_{EE} but separate supply pins V_{CC1} and V_{CC2}. The limiting amplifier and detector may be used with a supply voltage up to 3,5 V, the audio amplifier up to 10 V. The circuit is built to a large extent on the basis of long-tailed pairs with current sources in their tails. Thanks to the stabilizer diodes (D7, D8 and D9) the supply current of the audio amplifier varies little with the supply voltage. This permits the circuit to be used over a wide supply voltage range without an excessive battery drain as a result.

Limiting amplifier inputs I1 and REF and biasing output BIAS (pins 2, 3 and 4)

The limiting amplifier has differential inputs I1 and REF. I1 is intended to be used as an input; it should be biased externally by connecting it to the input biasing output BIAS via a resistor or an inductor. The reference input REF is biased internally; it should be decoupled by connecting a capacitor from REF to ground.

The onset of limiting is specified as the input voltage giving 3 dB gain reduction.

External RC network pins RCX1 to RCX4 (pins 4 to 8)

The TDB1080 contains a quadrature detector which requires an RC phase shifting network. This has to be connected to RCX1, RCX2, RCX3 and RCX4 as shown in Fig. 4. The component values have to be chosen in accordance with the i.f. centre frequency.

Audio amplifier inputs I2+ and I2- (pins 11 and 10)

The audio amplifier has differential inputs I2+ and I2- which are biased internally.

FUNCTIONAL DESCRIPTION (continued)

External capacitor pin CX (pin 12)

The internal biasing network for input I2 + should be decoupled by connecting an external capacitor between CX and ground.

Audio amplifier output QA and bootstrap pin BS (pins 15 and 13)

The audio amplifier has a class-B output stage. The maximum output voltage swing is obtained by connecting a capacitor between the bootstrap pin BS and the output QA and the load from BS to V_{CC2} (see Fig. 4).

The maximum output power varies from typ. 15 mW at $V_{CC2} = 2,5 \text{ V}$ to typ. 65 mW at $V_{CC2} = 9 \text{ V}$.

RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

Supply voltages, d.c.	V_{CC1}	max.	5 V
	V_{CC2}	max.	10 V
Supply current	$I_{CC1} + I_{CC2}$	max.	50 mA
Total power dissipation	P_{tot}	see Fig. 3

This data sheet contains advance information and specifications are subject to change without notice.

TDD1601

EQUALISER FOR AN AUDIO CASSETTE RECORDER

GENERAL DESCRIPTION

The TDD1601 is a CMOS switched capacitor circuit designed for high fidelity cassette recorders. This device compensates for the different types of tape, Ferro (FeO_2), Chrome (CrO_2) and Metal, that may be used and losses at the recording head. The TDD1601 has been optimized for use with the oscillator switch, TDA1600. The TDA1600 contains the oscillator for the erasing heads and playback amplifiers.

Features

- recording correction filters
- oscillator for the switched capacitor circuits
- drive outputs for the recording head and LED bar (recording level indicator)
- monitor paths
- programmable filter characteristics for different types of tape (FeO_2 , CrO_2 and Metal)

PINNING

FUNCTIONAL DESCRIPTION

Oscillator

The TDD1601 requires an external oscillator with a clock frequency of 131 kHz (1.5 x erasing frequency) and a stability of better than 1%. This oscillator will be stabilized by an external ceramic resonator (such as the Murata CSB524P).

The oscillator control input enables the switched capacitor circuits to operate at 262 kHz, this is to allow the alteration of the frequency characteristics. A LOW on the input forces the circuit to operate at 131 kHz. A HIGH on the input forces the circuit to operate at 262 kHz. The gains of the correction filters, at both frequencies, are specified in the section 'CHARACTERISTICS'.

FUNCTIONAL DESCRIPTION (continued)**Recording correction filters**

The recording correction path consists of 3 parts; a variable filter, a fixed filter and output buffers with gain correction.

Variable filter

The variable filter is used to compensate for the different types of tapes which may be used (FeO_2 , CrO_2 and Metal) and losses at the recording head. Depending upon the type of tape used the FeO_2 filter or CrO_2 filter or Metal filter will be switched in. The output of the filter in use will be switched to the fixed filter. The transfer function of the variable filter contain 2 zeros and 3 poles. The gain of the variable filter is 0 dB at 315 Hz. This device has been developed for use with a single recording head.

Fixed filter

The fixed filter provides a pole at 20 Hz and a zero at 50 Hz (standardized value). The gain of the fixed filter is 0 dB.

Output buffers

The output buffers drives the recording head. The output buffer provides gain correction for the type of tape and the tape recording heads. The gain factors are as follows:

- FeO_2 tape: 5 dB
- CrO_2 tape: 9 dB
- Metal tape: 9 dB

A high-pass filter is also built-in with one pole at 20 Hz. During playback the output of the recording correction filter is switched to GND.

LED bar drive (recording level indicator)

The LED bar drive is a buffer with a gain of 0 dB. The input of the buffer is connected to the output of the fixed filter in the recording path.

Monitor path

The monitor path consists of a switch and an output buffer. The switch is used to connect the input of the buffer to GND. The output buffer has a low output impedance (max. $2\ \Omega$). The input of the buffer requires a coupling capacitor to provide pop-free switching.

Command logic (see Fig. 4)

The command logic controls the switches used in the circuit. The inputs to the command logic are: TS1, TS2, MUTE, P/R and OSC3. The outputs are: TS3 and R/P. The filter characteristics are selected by TS1 and TS2 (see Table 1).

Table 1 Tape selection

Type of tape	TS1	TS2	TS3
FeO ₂	GND	GND	V _{DD}
CrO ₂	GND	open	GND
Metal	open	open	V _{SS}

TS3 indicates the position of the correction filters. This information is fed to TDA1600.

The P/R input selects the circuits required for record or playback mode. The output of R/P is connected to an external capacitor. When the P/R is LOW, a current of 120 μ A flows out of the R/P output and charges the external capacitor. A high voltage on the input of R/P discharges the external capacitor. If the voltage from the capacitor is between V_{DD} and GND the circuit operates in record mode. If the voltage is between GND and V_{SS} the circuit operates in the playback mode.

The MUTE input is used to mute the circuits. A low voltage on the MUTE input connects the input to the variable filter and the output of the monitor path to GND. A high voltage on the MUTE input connects the input of the variable filter to RECIL (or RECIR) and the output of the monitor path to MONIL (or MONIR).

RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

parameter	conditions	symbol	min.	max.	unit
Supply voltage range	V_{DD} to V_{SS}		−0,5	18	V

LOW POWER FREQUENCY SYNTHESIZER (LOPSY)

GENERAL DESCRIPTION

The TDD1742T is a low power, high-performance frequency synthesizer in local oxidation CMOS (LOC MOS) technology. The device is designed for use in channelized VHF/UHF applications especially portable and mobile radios.

The circuit incorporates many of the features of the HEF4750V (frequency synthesizer) and HEF4751 (universal divider), including a high-gain phase comparator together with an on-chip sample-and-hold capacitor and phase modulator.

A multiplexed or bus-structured programming sequence allows interface to a microcontroller or external memory (ROM/PROM); power is applied to the memory only when it is required for programming via additional on-chip circuitry.

Operation is possible with a minimum supply voltage of 7 V and a maximum input frequency of 8,5 MHz.

Encapsulation in a 28-lead mini-pack enables the construction of small, low power consumption synthesizers with low noise performance and high side-band attenuation.

Features

- On-chip sample-and-hold capacitor
- Low power consumption
- High-gain phase comparator with low levels of noise and spurious outputs
- Auxiliary digital phase comparator for fast locking
- On-chip phase modulator
- Simple interfacing to external memory
- Microcontroller compatible
- Power-on reset circuitry

DEVELOPMENT DATA

Pin functions

pin no.	mnemonic	description
1	V _{DD3}	Power Supply 3: analogue supply voltage (7 to 10 V).
2	PC1	Phase Comparator 1: high-gain analogue phase comparator output which is used when the system is in-lock to give low levels of noise and spurious outputs.
3	PC2	Phase Comparator 2: low-gain digital phase comparator 3-state output which enables the achievement of fast lock times when the system is initially out-of-lock. Phase comparator 2 is inhibited when the phase is within the locking range of phase comparator 1.
4	i.c.	internally connected (must be left floating).
5	CLK	Clock: clock output.
6	V _{SS}	Ground: circuit earth potential.
7	DIV(M)	Divider: input to the main programmable divider (8,5 MHz max.), usually from prescaler.
8	V _{DD2}	Power Supply 2: supply voltage for TTL-compatible stages (+ 5 V ± 10%).
9	FB	Feedback: feedback output to control the modulus of the external prescaler.
10	OL	Out-of-lock: out-of-lock indication flag output. This output is HIGH when phase comparator 2 is in operation (when the system is out-of-lock).
11	RESET	Power-on-Reset: Following power up an initial pulse is applied to this input pin to set the internal counters.

Pin functions (continued)

pin no.	mnemonic	description
12	XTAL	Crystal: output to external crystal to form the oscillator circuit in combination with the OSC input. Alternatively this pin may be used as a buffer output.
13	OSC	Oscillator: input to reference oscillator which together with the XTAL output and an external crystal is used to generate the reference frequency. Alternatively to OSC input may be used as a buffer amplifier for an external reference oscillator.
14	VDD1	Power Supply 1: digital supply voltage (7 to 10 V).
15-18	DB3-DB0	Data Bus: Data Bus inputs (TTL compatible).
19-21	AB0-AB2	Address Bus: TTL compatible bidirectional address bus. Provides address output to an external memory or input from microcontroller. The outputs are 3-state with internal pull-downs.
22	PE2	Program Enable 2: { TTL compatible inputs to initiate the programming cycle or strobe the internal Program Enable 1: { data latches.
23	PE1	
24	MOD	Modulator: high impedance linear phase modulator input, which applies a voltage controlled delay to the programmable divider output to the phase comparator.
25	<u>MEMEN</u>	Memory Enable: mode control and memory enable bidirectional pin. If pin 25 is LOW at general reset the TDD1742T is set to the microcontroller mode; if pin 25 is HIGH at general reset the TDD1742T is set to the memory mode and the ROM/PROM is enabled.
26	BRB	Bias Resistor B: current mirror which acts as gain control for the phase modulator.
27	BRC	Bias Resistor C: current mirror pin which provides analogue biasing.
28	BRA	Bias Resistor A: current mirror pin which acts as gain control for phase comparator 1.

FUNCTIONAL DESCRIPTION

Reference oscillator chain

The reference oscillator chain comprises a crystal oscillator and dividers to give the required frequency to drive the phase comparators.

The oscillator stage is a single inverter connected between pin 12 (XTAL) and pin 13 (OSC). Satisfactory operation is achieved with crystals up to 9 MHz. Alternatively, the OSC input may be used as a buffer amplifier for an external reference oscillator.

The reference divider chain comprises a fixed divide by 4-stage followed by three cascaded programmable dividers of ratios $\div 12/13/14/15$, $\div 5/6/7/9$ and $\div 1/2/4/8$. The output of the last stage is applied as one input (R) to the two phase comparators. Thus a number of division ratios between 240 and 4320 are possible which provides all the required VHF and UHF channel spacings with reference crystals in a 1 to 9 MHz range.

Main programmable divider

The main programmable divider is a rate feedback binary divider. As shown in figure 1 it comprises a fixed 7-bit binary divider ($\div 128$) and two rate selectors (n_1 and n_0). One rate selector controls a 7-bit fully programmable dual modulus divider ($\div n_2/n_2 + 1$) and the other controls the external dual modulus prescaler ($\div A/A + 1$).

The overall division rate (N) is given by:

$$N = (128 n_2 + n_1) A + n_0$$

Where:

$$0 \leq n_0 \leq 127$$

$$0 \leq n_1 \leq 127$$

$$1 \leq n_2 \leq 127.$$

The output from the programmable divider is fed to the phase comparators via the phase modulator and the multiplexer. The phase modulator is bypassed if not selected.

Phase comparison

The TDD1742T contains 2 phase comparators which act in close co-operation. Phase comparator 1 is the main comparator. It is designed to have a high-gain analogue output, 4500 volts/cycle at 10 kHz (typ.). This enables a low noise performance to be achieved. However, the output of phase comparator 1 will saturate at high or low levels for very small phase excursions.

Phase comparator 2 is an auxiliary comparator with a wide range, which enables faster lock times to be achieved than otherwise would be possible. This digital phase comparator has a linear $\pm 2\pi$ radians phase range, which corresponds to a gain of $\frac{V_{DD}}{2}$ volts/cycle.

To avoid degrading the noise performance of the system by the relatively low gain of phase comparator 2, once a small phase error has been achieved an internal switch disconnects phase comparator 2, leaving only phase comparator 1 connected. Thus the low noise properties of phase comparator 1 are obtained once phase-lock has been achieved.

FUNCTIONAL DESCRIPTION (continued)**Phase comparator 1** (see Fig. 3)

Phase comparator 1 is comprised of a linear ramp generator and a sample and hold circuit.

Fig. 3 Simplified block diagram of phase comparator 1.

A negative-going transition at the V_{MUX} input causes the hold capacitor C_A to be discharged via switch S1 and constant current source I_1 .

A positive-going transition at the V_{MUX} input causes the hold capacitor C_A to be charged via switch S2 and constant current source I_2 , which produces a linear ramp.

A negative-going transition at the R input terminates the linear ramp.

Capacitor C_A holds the voltage that the ramp has attained, and is buffered by the voltage follower VF1. After the output of VF1 is stable ($2 \mu s$), the sample switch S3 is closed for approximately $1 \mu s$ by the one-shot oscillator. This enables the capacitor C_C to charge to the voltage level of VF1 and in turn buffered by voltage follower VF2 made available at output PC1.

The construction and small duty cycle of the sample switch S3 provides a low hold step, resulting in a minimum side-band level.

If the linear ramp terminates before a negative-going transition at the R input is present, an end of ramp (EOR) signal is produced, generating in turn an out-of-lock (OL) signal. OL enables phase comparator 2 via the out-of-lock detector.

These actions are illustrated in the waveforms of Fig. 4 and Fig. 5.

The gain of phase comparator 1 as measured at PC1 is given by:

$$PC \text{ gain} \approx \frac{446 I_{BRA}}{F_R}$$

Where:

I_{BRA} is in μA

F_R is the phase comparator reference frequency in kHz

Fig. 4 Waveforms of phase comparator 1; in-lock condition.

Fig. 5 Waveforms of phase comparator 1; out-of-lock condition.

When V_{MUX} leads R the output signal at pin 2 (PC1) is proportional to the phase difference (in-lock condition) or HIGH (out-of-lock condition).

When R leads V_{MUX} the output signal at pin 2 (PC1) remains LOW.

Fig. 6 Phase characteristic of output PC1.

The output of phase comparator 2 produces positive or negative going pulses with variable width, dependent on the phase relationship of R and V_{MUX} .

The average output voltage is a linear function of the phase difference. Output at pin 3 (PC2) remains in the high impedance OFF-state in the region in which phase comparator 1 operates

Fig. 9 Phase characteristic of output PC2.

To reach the reset state of phase comparator 2 it is necessary to apply:

- $2V_{MUX} + R^*$
- or
- $2R + V_{MUX}$

Thus to achieve the R leads V_{MUX} state $2R$ must be applied; to achieve the V_{MUX} leads R state $2V_{MUX}$ must be applied.

DEVELOPMENT DATA

Out-of-lock function

There are several situations when the system goes from the locked to the out-of-lock state (OL output goes HIGH):

- V_{MUX} leads R, however out of the range of phase comparator 1
- R leads V_{MUX}
- R-pulse is missing
- V_{MUX} -pulse is missing

In the first three situations the locked state can be reset by applying two successive cycles within the range of phase comparator 1.

In the fourth situation the locked state can be reset by applying a V_{MUX} pulse followed by two successive cycles within the range of phase comparator 1.

Phase modulator (see Fig. 10)

The linear phase modulator applies a voltage controlled delay to the signal from the programmable divider to the phase comparator input. The gain of the phase modulator is adjustable via an external bias resistor (BRB) which is connected between pin 26 and ground.

The time delay introduced into the V path to the phase modulator is:

$$\frac{909}{I_{BRB}} \text{ ns/volt of input applied to pin 24 (MOD)}$$

When a positive-going transition appears at the V-input, the D type flip-flop produces a HIGH V' level and causes capacitor C_B to produce a positive-going ramp via switch S1 and constant current source I_1 starting at the V_{SS} potential. When the ramp has reached a value equal to the modulation input voltage (at MOD), the comparator resets the D type flip-flop, which terminates the V pulse. C_B now discharges to V_{SS} via switch S1 and constant current source I_2 and the circuit returns to the start position. Because the trailing edge of the V' pulse is the active edge for the phase comparators, a linear phase modulation is achieved. The associated waveforms are shown in Fig. 11. The phase modulator can be switched OFF, via the programming logic, to avoid superfluous dissipation. To achieve, this the M signal must be programmed to logic 0. The V pulse will then be connected via switch S2 to V_{MUX} .

* This means apply two successive active V_{MUX} edges followed by one active R edge.

FUNCTIONAL DESCRIPTION (continued)

Fig. 10 Simplified block diagram of the phase modulator.

Fig. 11 Phase modulator waveforms; $M = 1$.

Program control

A multiplexed or bus structured sequence allows the TDD1742T to be interfaced to a microcontroller or a PROM.

The device is fully programmable in terms of:

- 6 bits to define the reference divider ratio
- 21 bits to define the main divider ratio
- 1 bit to switch the modulator
- 4 bits to determine the test status

Thus the TDD1742T is programmed with a total of 32 bits which are organized as eight 4-bit words.

The address bus is 3 bits wide and the data bus is 4 bits wide. Both buses are TTL compatible.

The data words are described in detail in Tables 3 to 7.

Microcontroller mode

If pin 25 ($\overline{\text{MEMEN}}$) is LOW at general reset, the device is set to the micro-controller mode. In this mode a 7-bit word, comprised of 3 address bits (AB0 to AB2) and 4 data bits (DB0 to DB3), may be strobed into the TDD1742T when the program enable pins PE1 and PE2 are set to opposite state (EXCLUSIVE-OR condition; see Fig. 12 and Table 2). One frame of 8 words is necessary to completely program the TDD1742T. Incoming data is not clocked into the internal counter latches until after the receipt of data corresponding to address 111. Upon subsequent reprogramming it is not necessary to change all eight words but a reprogramming sequence must always finish with the data corresponding to address 111.

(1) Address and data valid.

(2) Address and data not valid.

Table 2 Truth table for program enable function; microcontroller mode

PE1	PE2	load
0	0	NO
1	0	YES
0	1	YES
1	1	NO

Program control (continued)**Memory mode (PROM)**

If pin 25 ($\overline{\text{MEMEN}}$) is HIGH at general reset, TDD1742T is set to the memory mode and a programming cycle is initiated. Subsequent reprogramming is performed by applying a pulse to program enable PE1 (pin 23) or PE2 (pin 22). If PE1 is LOW, programming will occur on the LOW-to-HIGH transition of PE2. If PE1 is HIGH, programming will occur on the HIGH-to-LOW transition of PE2. PE1 and PE2 are interchangeable. Reprogramming will also occur by applying a pulse to RESET (pin 11).

At the start of a programming sequence pin 25 goes LOW and may be used to apply power to the memory via an external driver. After a settling time the address bus outputs 000 followed by the remaining seven addresses. During the second half of each address period data, from the memory is latched into the TDD1742T so that the access time of the PROM is not critical.

Note

The program clock is derived from the reference divider chain and its frequency equals $f_{\text{OSC}}/4R_0$.

After the full 32 bits have been read the address returns to address 000 before going 3-state. This step transfers data from the internal data latches to the appropriate divider latches. Pin 25 now returns to a high impedance state and power is removed from the memory. Fig. 13 shows the timing for a reset initiated programming sequence; the timing is similar for program enable initiated sequence.

(1) Delay time for PROM settling.

(2) The program clock is derived from the reference divider chain.

(3) Data is valid during the shaded period.

Current biasing

Current biasing is provided by 3 external bias resistors A, B and C.

Bias Resistor A: is connected between pin 28 (BRA) and ground. The value of the resistor must be such that $I_{BRA} = 20 \mu A$, which acts as gain control for analogue phase comparator 1.

Bias Resistor B: is connected between pin 26 (BRB) and ground. The value of the resistor must be such that $I_{BRB} = 3$ to $25 \mu A$, which acts as gain control for the phase modulator.

Bias Resistor C: is connected between pin 27 (BRC) and ground. The value of the resistor must be such that $I_{BRC} = 5$ to $30 \mu A$, which provides biasing for the remainder of the analogue circuitry.

DOLBY* B & C TYPE NOISE REDUCTION CIRCUITS

GENERAL DESCRIPTION

The TEA0651/TEA0652 and TEA0654 provide both, Dolby B and Dolby C type audio Noise Reduction (NR). The TEA0651/TEA0652 are NR signal processing ICs in 18-lead DIL packages. They can be used either as a stereo Dolby B NR circuit or as one channel of a switchable Dolby B & C NR circuit. In addition they provide NR ON/OFF switching.

The TEA0654 is a switching IC in a 24-lead DIL package. It contains the switching, the pre-amplifiers for playback and recording functions and a multiplex filter buffer amplifier.

The circuits are pin compatible to Signetics NE651, NE652 and NE654 respectively.

Features

TEA0651/TEA0652

- Dual purpose IC for Dolby B & C NR systems:
 - switchable B/C type NR systems, B-type NR systems (stereo without preamplifiers), automotive entertainment systems (playback only) and portable applications
- Dual version for better matching between HIGH and LOW level stages in C-type NR or better channel matching for stereo B-type NR applications
- Full-wave rectifier
- No capacitive divider for side-chain filter needed
- Electronic switching for NR ON/OFF, B and C-type NR
- Dolby level 0 dB = -6 dBm (387,5 mV) offers line output level option of 0 dBm (775 mV)

TEA0654

- Electronic switching for playback/record
- Electronic switching for NR ON/OFF and B/C type NR
- No internal/external matching required for filter networks:
 - only one network for spectral skewing and deskewing necessary; only one network for anti-saturation necessary
- Excellent matching between record and playback
- Line output (monitor) level externally set by resistor ratio independent of internal Dolby level
- Playback and record preamplifier and multiplex filter buffer amplifier included

PACKAGE OUTLINES

TEA0651/TEA0652: 18-lead DIL; plastic (SOT102H).

TEA0654: 24-lead DIL; plastic (SOT101A).

* Available only to licensees of Dolby Laboratories Licensing Corporation, San Francisco, CA94111, U.S.A., from whom licensing and application information must be obtained.
Dolby is a registered trademark of Dolby Laboratories Licensing Corporation.

	C	—	voltage at test point 2	0,85 x V_{CC}	—	—	V

Notes to system characteristics

1. Operation with minimum of 12 dB headroom; system remains functional to 6 V.
2. Attenuation between pins 2 and 3 of TEA0654 is 4 dB;
3. System headroom is determined by programmable monitor output level (pin 5 of TEA0654).
4. For a typical application see Fig. 10. Worst case considerations for the V_{CC} range from 8 V to 20 V limit the optional external resistor to maximum 6,8 k Ω , divided by number of switched channels.
5. In the open position (B) of the mode switch pin 14 of TEA0651/TEA0652 is pulled to typical $0,25 \times V_{CC}$ by pin 4 of TEA0654.

TEA0653T

DOLBY B TYPE NOISE REDUCTION CIRCUIT

GENERAL DESCRIPTION

The TEA0653T is a monolithic bipolar IC designed for use in Dolby B type audio Noise Reduction (NR) systems. The device is a dual channel circuit.

Applications

- Automotive cassette players
- Home cassette decks
- Portable cassette players
- Video cassette recorders
- FM receivers

Features

- Dual processors provide optimum matching of channels
- No law adjustments required
- Full wave rectifier
- No capacitor required for side chain filter
- Electronic switching for NR ON/OFF
- Reference level 0 dB = 387,5 mV
- Minimum external components
- Easy to apply in 2 or 3 head systems
- Split supply operation is optional

QUICK REFERENCE DATA

Supply voltage	max.	20 V
Supply current	typ.	17 mA
Signal-to-noise ratio	typ.	90 dB
Storage temperature range		-55 to +150 °C
Operating ambient temperature range		-30 to +85 °C

PACKAGE OUTLINES

TEA0653T: 20-lead mini-pack; plastic (SO28; SOT136A).

* Available only to licensees of Dolby Laboratories Licensing Corporation, San Francisco, CA94111, U.S.A., from whom licensing and application information must be obtained. Dolby is a registered trademark of Dolby Laboratories Licensing Corporation.

DUAL DOLBY* B—TYPE NOISE REDUCTION CIRCUIT

GENERAL DESCRIPTION

The TEA0657 is a monolithic bipolar integrated circuit providing two channels of Dolby B-type noise reduction. The circuit contains all internal electronic switching to provide playback or record functions.

In addition the TEA0657 includes preamplifiers for the playback and record modes and multiplex filter buffers for both channels.

The device will operate with power supplies in the range of 9.0 V to 15.0 V, output overload level increasing with increase in supply voltage. Current drain varies with supply voltage and noise reduction ON/OFF so it is advisable to use a regulated power supply or, a supply with a long time constant.

Features

- Dual noise reduction channels
- Full playback/record switching
- Separate playback/record inputs
- Multiplex filter buffers
- Simultaneous switching on both channels
- Dual or single supply operations
- Dolby reference level = 580 mV
- Input sensitivity = 30 mV

QUICK REFERENCE DATA

parameter	symbol	min.	typ.	max.	unit

21	CTRL B	control voltage channel B
22	INT B	integrating filter channel B
23	MODE	record/playback select switch
24	GND	ground

FUNCTIONAL DESCRIPTION

Noise reduction is enabled when pin 22 is open-circuit and OFF when connected to pin 24 via a 5.1 k Ω resistor (see Fig. 3).

Pin 24 performs the functions of a logic input for noise reduction switching in both channels and provides smoothing for the control signal in one channel. It is important that no voltage is applied to this pin when in the NR ON mode as this will cause irregular noise reduction characteristics in the selected channel.

Record/playback is achieved by applying a DC voltage to pin 23. The circuit will enable the appropriate input for the selected mode.

RATINGS

Limiting values in accordance with the Absolute Maximum Rating System (IEC 134)

parameter	symbol	min.	max.	unit
Supply voltage	V _{CC}	—	16.0	V
Operating ambient temperature range	T _{amb}	−40	+ 85	°C
Storage temperature range	T _{stg}	—	+ 150	°C
Input voltage (pin 1)	V _I	−0,3	V _{CC}	V

TEA0665
TEA0665T

DOLBY* B and C TYPE NOISE REDUCTION CIRCUIT

GENERAL DESCRIPTION

The TEA0665 is designed for use in Dolby B and Dolby C type audio Noise Reduction (NR) systems. The device provides the high and low level stages for one channel of a Dolby C-type NR system, including NR ON/OFF switching and all electronic switching necessary for Dolby C-type systems. In addition the TEA0665 includes a preamplifier for the record and playback functions and a multiplex buffer amplifier. The circuit offers two different line-output levels (-6 and 0 dBm) and a low-pass filter, which can be fed into the signal path in playback mode.

Features

- Few external components required
- Included RECORD/PLAY preamplifiers plus multiplex filter buffer amplifier
- Two different line-output levels
- All electronic switching

PACKAGE OUTLINES

TEA0665: 28-lead DIL; plastic (SOT117).

TEA0665T: 28-lead mini-pack; plastic (SO28; SOT136A).

* Available only to licensees of Dolby Laboratories Licensing Corporation, San Francisco, CA94111, U.S.A., from whom licensing and application information must be obtained.
Dolby is a registered trademark of Dolby Laboratories Licensing Corporation.

			pin 28	R ₂₈₋₂₇	35	50	65	kΩ
Output resistance			pin 6	R ₆₋₂₇	—	160	220	Ω
			pin 21	R ₂₁₋₂₇	—	60	100	Ω

Notes to the characteristics

1. Operation with minimum of 12 dB headroom; system remains functional to 7 V.
2. Attenuation between pins 1 and 3 is 3,5 dB (MPX-filter).
Playback input sensitivity is 45 mV if a switchable MPX-low pass filter is used in playback mode (pins 2 and 3 short-circuited).
3. System headroom is determined by the line output channel in use.
For low supply voltages line output 2 (pin 6) will saturate at high signal levels. Headroom for line output 1 (pin 5) tracks with record output (pin 21).
4. The equation for REC/PB switch input voltage is:
REC: $V_{24-27} > 0,55 V_{CC} - V_{BE} + 1,5 V$,
PB: $V_{24-27} < 0,45 V_{CC} - V_{BE} - 1,5 V$.
5. The equation for C/B/OFF mode switch input voltage is:
OFF: $V_{25-27} < 0,38 V_{CC} - V_{BE} - 1 V$,
B: $0,45 V_{CC} < V_{25-27} < 0,55 V_{CC}$ (external voltage),
C: $0,5 V_{CC}$ (switch in open position),
C: $V_{25-27} > 0,75 V_{CC} - V_{BE} + 1 V$.

The voltage drop across the external time constant resistor must be taken in to account.

TEA0666
TEA0666T

DOLBY* B and C TYPE NOISE REDUCTION CIRCUIT

GENERAL DESCRIPTION

The TEA0666 is designed for use in Dolby B and Dolby C type audio Noise Reduction (NR) systems. The device provides the high and low level stages for one channel of a Dolby C-type NR system, including NR ON/OFF switching and all electronic switching necessary for Dolby C-type systems. In addition the TEA0666 includes a preamplifier for the record and playback functions and a multiplex buffer amplifier. The circuit offers two different line-output levels (–6 and 0 dBm) and a low-pass filter, which can be fed into the signal path in playback mode.

TEA0666 is a selected version of TEA0665 with respect to frequency response, making it especially suitable for high end applications such as 3-head cassette decks and other group A products.

Features

- Few external components required
- Included RECORD/PLAY preamplifiers plus multiplex filter buffer amplifier
- Two different line-output levels
- All electronic switching

PACKAGE OUTLINES

TEA0666: 28-lead DIL; plastic (SOT117).

TEA0666T: 28-lead mini-pack; plastic (SO28; SOT136A).

- * Available only to licensees of Dolby Laboratories Licensing Corporation, San Francisco, CA94111, U.S.A., from whom licensing and application information must be obtained.
Dolby is a registered trademark of Dolby Laboratories Licensing Corporation.

TEA0670T

LOW VOLTAGE DOLBY B/C TYPE

DESCRIPTION

The TEA0670T is a monolithic IC intended for use in low voltage Dolby* B and C type noise reduction applications. This IC design features both record and playback modes with all internal electronic switching.

FEATURES

- B and C type noise reduction
- Low voltage operation 1.8 to 8 V
- Playback and record modes
- 0 dB (Dolby level) = 100 mV
- Record input sensitivity 50 mV
- Playback sensitivity 20 mV
- All electronic switching

APPLICATION

- Portable tape recorders/players.

PACKAGE OUTLINE

28-lead mini-pack; plastic (SO28; SOT136A).

* Dolby is a registered trademark of Dolby Laboratories Licensing Corporation, San Francisco, California (U.S.A.).

TEA5551T

1-CHIP AM RADIO

GENERAL DESCRIPTION

The TEA5551T is a 1-chip monolithic integrated radio circuit which is designed for use as a pocket receiver with headphones in a supply voltage range (V_S) of 1.8 V to 4.5 V.

The circuit consists of a complete AM part and dual AF amplifier with low quiescent current. The AF part has low radiation (HF noise) and good overdrive performance. The dual AF amplifier makes the device suitable for operation in an AM/FM stereo receiver with or without stereo cassette player.

The IC has a 1-pin switch for AM or other applications.

Features

- Low voltage operation ($V_S = 1.8 \text{ V}$ to 4.5 V)
- Low current consumption ($I_{\text{tot}} = 5 \text{ mA}$ at $V_S = 3 \text{ V}$)
- All pins provided with ESD protection

AM part

- High sensitivity ($V_i = 1.5 \mu\text{V}$ for $V_o = 10 \text{ mV}$)
- Good IF suppression
- Good signal handling ($V_{i(\text{max})} = 80 \text{ mV}$)
- Switch for AM or other applications

AF part

- A fixed integrated gain of 32 dB
- Few external components required
- Very low quiescent current
- Low HF radiation and good AF overdrive performance
- 0 to 20 kHz limited frequency response
- 25 mW per channel output power in 32 Ω

RF/IF CIRCUIT FOR AM/FM RADIO

GENERAL DESCRIPTION

The TEA5570 is a monolithic integrated radio circuit for use in portable receivers and clock radios. The IC is also applicable to mains-fed AM and AM/FM receivers and car radio-receivers. Apart from the AM/FM switch function the IC incorporates for AM a double balanced mixer, 'one-pin' oscillator, i.f. amplifier with a.g.c. and detector, and a level detector for tuning indication. The FM circuitry comprises i.f. stages with a symmetrical limiter for a ratio detector. A level detector for mono/stereo switch information and/or indication complete the FM part.

Features

- Simple d.c. switching for AM to FM by only one d.c. contact to ground (no switch contacts in the i.f. channel, a.f. or level detector outputs)
- AM and FM gain control
- Low current consumption ($I_{tot} = 6 \text{ mA}$)
- Low voltage operation ($V_P = 2,7 \text{ to } 9 \text{ V}$)
- Ability to handle large AM signals; good i.f. suppression
- Applicable for inductive, capacitive and diode tuning
- Double smoothing of a.g.c. line
- Short-wave range up to 30 MHz
- Lumped or distributed i.f. selectivity with coil and/or ceramic filters
- AM and a.g.c. output voltage control
- Distribution of PCB wiring provides good frequency stability
- Economic design for 'AM only' receivers

QUICK REFERENCE DATA (at $T_{amb} = 25^\circ\text{C}$)

D.C. output voltage					
at $V_i = 300\text{ }\mu\text{V}$	V_{12-16}	—	0,25	—	V
at $V_i = 2\text{ mV}$	V_{12-16}	—	1,0	—	V
AM to FM switch					
Switching current at $V_{3-16} < 1\text{ V}$	$-I_3$	—	—	400	μA

Notes to characteristics

1. Oscillator operates at $V_{7-16} > 2,25 \text{ V}$.
2. I.F. suppression is defined as the ratio $\alpha = 20 \log \frac{V_{i1}}{V_{i2}}$ where: V_{i1} is the input voltage at $f = 455 \text{ kHz}$ and V_{i2} is the input voltage at $f = 1 \text{ MHz}$.
3. Oscillator voltage at pin 8 can be preset by R_{osc} (see Fig. 10).
4. Maximum current into pin 5 can be adjusted by $R1$ (see Fig. 10);

$$I_5 = \frac{V_{3-16}}{R1} - I_3 \text{ when } V_{3-16} = 800 \text{ mV}; I_3 = 400 \mu\text{A}.$$
5. AM suppression is measured with $f_m = 1 \text{ kHz}$, $m = 0,3$ for AM; $f_m = 400 \text{ Hz}$, $\Delta f = \pm 22,5 \text{ kHz}$ for FM.

Facility adaptation

Facility adaptation is achieved as follows (see Fig. 10):

Facility	Component
FM sensitivity	$R1$ fixes the current at pin 5 ($I_5 = \frac{V_{3-16}}{R1} - 400 \mu\text{A}$) (gain adjustable $\pm 10 \text{ dB}$; see note 4)
AM sensitivity	$R11$ and coil tapping
AM oscillator biasing	R_{osc}
AM output voltage	$R7, R11$
AM a.g.c. setting	$R7$

PLL STEREO DECODER

GENERAL DESCRIPTION

The TEA5580 PLL stereo decoder is for car, portable and mains-fed medium-fi radios and radio recorders. It features a 228 kHz voltage-controlled oscillator (VCO) that is locked to the 19 kHz stereo pilot tone by a phase-locked loop (PLL) system. Subcarrier frequencies of 19, 38, 57 and 114 kHz are regenerated via I²L logic from the VCO output.

The PLL phase detector suppresses phase distortion due to the 57 kHz pilot tone from the German 'Verkehrs Warnfunk' (VWF) traffic warning system. Typical suppression of the 19 kHz stereo pilot tone is 50 dB, or up to 60 dB with adjustment of the pilot-cancelling resistor (R3, Figs 3 and 4). Adjacent channel interference is prevented by the use of two demodulators, one driven by the 38 kHz decoding signal and the other at 114 kHz to suppress the third harmonic of the multiplexed input signal.

The gain of the input amplifier can be adjusted by an external resistor and the circuit includes compensation for an IF filter typical roll-off frequency of 50 kHz (2 dB down at 38 kHz).

The supply voltage range of the circuit is 3,6 V to 16 V.

Features

- Wide supply voltage range
- Automatic mono/stereo switching (pilot presence detector)
- Smooth stereo-to-mono change-over at weak signals (signal-dependent stereo channel separation)
- LED driver for stereo/mono indicator
- Suppresses:
 - third harmonics (114 kHz) of multiplexed signal to prevent interference from strong adjacent channels;
 - phase distortion due to the 57 kHz signal from VWF transmitters
- Pilot cancelling circuit to give added suppression of 19 kHz pilot tone
- IF filter roll-off compensation

PACKAGE OUTLINE

16-lead DIL; plastic (SOT38).

Fig. 1 Block diagram.

Notes to the characteristics

1. Minimum supply voltage only applicable in 6 V portable.
2. Without LED-driver current.
3. Guaranteed for mono, mono + pilot, stereo.
4. Also adjustable.
5. Reference output voltage at 1 kHz (measured channel R, pin 2).
6. Intermodulation suppression (BFC: Beat-Frequency Components):

$$\alpha_2 = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 1 kHz)}}; f_s = (2 \times 10 \text{ kHz}) - 19 \text{ kHz}$$

$$\alpha_3 = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 1 kHz)}}; f_s = (3 \times 13 \text{ kHz}) - 38 \text{ kHz}$$

measured with 91% mono signal; f_m = 10 or 13 kHz; 9% pilot signal.

7. Traffic radio (VWF) tone suppression:

$$\alpha_{57} = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 1 kHz} \pm 23 \text{ Hz)}}$$

measured with 91% stereo signal; f_m = 1 kHz; 9% pilot signal; 5% traffic subcarrier (f = 57 kHz; 60% AM modulated with f_{mod} = 23 Hz).

8. SCA (Subsidiary Communication Authorization) tone rejection:

$$\alpha_{67} = \frac{V_{O(\text{signal})} \text{ (at 1 kHz)}}{V_{O(\text{spurious})} \text{ (at 9 kHz)}}; f_s = (2 \times 38 \text{ kHz}) - 67 \text{ kHz}$$

measured with 81% mono signal; f_m = 1 kHz; 9% pilot signal; 10% SCA-subcarrier (f_s = 67 kHz, unmodulated).

9. ACI (Adjacent Channel Interference) rejection at:

$$\alpha_{114} = \frac{V_{o(\text{signal})} \text{ (at 1 kHz)}}{V_{o(\text{spurious})} \text{ (at 4 kHz)}} ; f_s = (3 \times 38 \text{ kHz}) - 110 \text{ kHz}$$

$$\alpha_{190} = \frac{V_{o(\text{signal})} \text{ (at 1 kHz)}}{V_{o(\text{spurious})} \text{ (at 4 kHz)}} ; f_s = (5 \times 38 \text{ kHz}) - 186 \text{ kHz}$$

measured with 90% mono signal; $f_s = 1 \text{ kHz}$; 9% pilot signal; 1% spurious signal ($f_s = 110$ or 186 kHz , unmodulated).

10. The capture range of the PLL may be decreased to 4% by changing the value of C2 to 470 nF (see Fig. 4), if a small ambient temperature range is provided.

Fig. 3 Car radio application and test circuit.

Fig. 4 Portable application circuit.

Notes to Figs 3 and 4

- (1) R4: VCO frequency adjustment (228 kHz).
 (2) R3: pilot cancelling or pilot level adjustment; best adjustment obtained with 470 k Ω potentiometer (see Figs 7 and 8); adjust for pilot cancellation of approx. 58 dB $\pm$ 10 dB and pilot sensitivity (mono to stereo) of approx. 23 mV $\pm$ 3 mV.

— $R_5 = R_6 = 12$ k Ω

PLL STEREO DECODER

GENERAL DESCRIPTION

The TEA5581 PLL stereo decoder is for car and medium-fi radios. It incorporates all the features provided by the TEA5580 together with a source selector, muting circuit and output amplifiers with adjustable gain. It also features a switch for radio or cassette function and a 228 kHz voltage-controlled oscillator (VCO) that is locked to the 19 kHz stereo pilot tone by a phase-locked loop (PLL) system. Subcarrier frequencies of 19, 38, 57 and 114 kHz are regenerated via I^2L logic from the VCO output.

The PLL phase detector suppresses phase distortion due to the 57 kHz pilot tone from the German 'Verkehrs Warnfunk' (VWF) traffic warning system. Typical suppression of the 19 kHz stereo pilot tone is 40 dB. Adjacent channel interference is prevented by the use of two demodulators, one driven by the 38 kHz decoding signal and the other at 114 kHz to suppress the third harmonic of the multiplexed input signal.

The gain of the input amplifier can be adjusted by an external resistor and the circuit includes compensation for an IF filter typical roll-off frequency of 50 kHz (2 dB down at 38 kHz).

The supply voltage range of the circuit is 7 V to 16 V.

Features

- Wide supply voltage range
- Automatic mono/stereo switching (pilot presence detector)
- Smooth stereo-to-mono change-over at weak signals (signal-dependent stereo channel separation)
- LED driver for stereo/mono indicator
- Suppresses:
 - third harmonics (114 kHz) of multiplexed signal to prevent interference from strong adjacent channels;
 - phase distortion due to the 57 kHz signal from VWF transmitters
- Pilot cancelling circuit to give added suppression of 19 kHz stereo pilot tone (up to 25 dB)
- IF filter roll-off compensation
- Source selector for radio or cassette input (typ. 90 dB)
- Mute circuit for 90 dB (typ.) muting of the output level
- Matrix and two output buffers with adjustable gain (max. 20 dB)

PACKAGE OUTLINES

TEA5581 : 16-lead DIL; plastic (SOT38).

TEA5581T: 16-lead mini-pack; plastic (SO16L; SOT162A).

APPLICATION INFORMATION

- (1) 25% tolerance (all other resistors have a 5% tolerance).
 (2) 1% tolerance (NPO).

Fig. 7 Application diagram.

AM/FM RADIO RECEIVER CIRCUIT

GENERAL DESCRIPTION

The TEA5591 is an integrated radio circuit which is designed for use in portable receivers and clock radios. The IC is also applicable to mains-fed AM and AM/FM receivers and car radio-receivers. The main advantage of this IC is its ability to operate over a wide range of supply voltages without loss of performance. The AM circuit incorporates a balanced mixer and a 'one-pin' oscillator, which operates in the 0.6 MHz to 30 MHz frequency range, with amplitude control. The circuit also includes an IF amplifier, a detector and an AGC circuit which controls the IF amplifier and the mixer. The FM circuit incorporates an RF amplifier, a balanced mixer and a 'one-pin' oscillator together with two AC coupled IF amplifiers (with distributed selectivity), a quadrature demodulator for the ceramic filter and internal AFC.

Features

- DC AM/FM switch facility
- Three internal separate stabilizers to enable operation over a wide range of supply voltages (1.8 to 15 V)
- All pins (except pin 9) are ESD protected

FM/IF SYSTEM AND MICROCOMPUTER-BASED TUNING INTERFACE

GENERAL DESCRIPTION

The TEA6100 is a FM/IF system circuit intended for microcomputer controlled radio receivers. The circuit includes highly sensitive analogue circuitry. The digital circuitry, including an I²C bus, controls the analogue circuitry and the AM/FM tuning and stop information for the microcomputer.

Features

- 4-stage symmetrical IF limiting amplifier
- Software selectable AM or FM input
- Symmetrical quadrature demodulator
- Single-ended LF output stage
- D.C. output level determined by the input signal
- Semi-adjustable AM and FM level voltage
- Multi-path detector/rectifier/amplifier circuitry
- 3-bit level information and 3-bit multi-path information
- Signal dependent 'soft' muting circuit; externally adjustable
- Reference voltage output (FM mode only)
- 8-bit AM/FM frequency counter with selectable counter resolution
- Possibility to measure the AM IF frequency at 460 kHz (250 Hz resolution) and 10,7 MHz (500 Hz resolution)
- Reference frequency can be directly connected to the reference frequency output of a frequency synthesizer (TSA6057, 40 kHz)

PACKAGE OUTLINE

20-lead DIL; plastic (SOT146).

DEVELOPMENT DATA

Fig. 1 Block diagram.

FUNCTIONAL DESCRIPTION (see Figs 1 and 13)

The IF amplifier consists of four balanced limiting amplifier stages, two separate inputs (AM and FM) and one output. Software programming (see Table 2; Figs 4 and 5) allows the input signals (AM/FM) to be inserted on either input (pin 18 or 19). The output drives the frequency counter and via the mute stage, drives the quadrature detector. The output of the quadrature detector is applied to an audio stage (which has a single-ended output). The AM/FM level amplifier, which is driven by 5 IF level detectors, generates a signal dependent d.c. voltage. The level output voltage is used internally to control the mute stage and, if required, the signal can be used externally to control the stereo channel separation and frequency response of a stereo decoder. The signal is also feed to the analogue-to-digital converter (ADC). Due to the front-end spread in the amplification, the level voltage is made adjustable (LADJ, pin 14). The level voltage amplifier controls the mute stage and this insures the -3 dB limiting point remains constant, independent of the front-end spread. AM and FM mode have different front-end circuitry, therefore LADJ must be adjustable for both inputs.

The output voltage of the level amplifier is dependent upon the field strength of the input signal. The multi-path of the FM signal exists in the AM modulation of the input signal. The following method is used to determine the level information and the amount of multi-path (as a DC voltage):

- the IF level detector detects the multi-path and feds the signal, via the level amplifiers, to the external bandpass filter (pin 3) and ADC1
- the signal is then fed to an internal rectifier
- the rectified signal is then fed to an amplifier, so at pin 5 the DC level information is externally available and internally used by ADC2

In the FM mode, the DC information concerning the multi-path is available at pin 5 and the level information is available at pin 3.

In the AM mode, the level information at pin 3 cannot be directly used owing to AM modulation on the output signal of the level amplifier. This signal requires filtering, which is achieved by the following method:

- the multiplexer is switched to a position which causes the signal to be applied to the attenuator
- after attenuation the signal is fed to an amplifier (the resultant gain of attenuator and amplifier is unity), after amplification the signal is filtered by an internal resistor and external capacitor
- after filtering the signal is applied to ADC2 and is externally available

In AM mode pin 5 contains the level information.

The voltages on pin 3 and 5 are converted into two 3-bit digital words by the ADC, which can then be read out by the I²C bus. The meaning of the 3-bit words is shown in Table 1.

Table 1 3-bit words

word	position	
	FM	AM
1	multipath	level without modulation
2	level	level with modulation

The FM modulated signal is converted into an audio signal by the symmetrical quadrature detector. The main advantage of such a detector is that it requires few external components.

An FM signal requires good AM suppression, and as a result, the IF amplifiers must act as limiters. To achieve good suppression on small input signals the IF amplifiers must have a high gain and thus a high sensitivity. High sensitivity is an undesirable property when used in car radio applications, this problem is solved by having an externally adjustable mute stage to control the overall sensitivity of the device.

The IF mute stage is controlled by the level amplifier (soft muting) and is only active in FM mode. If the input falls below a predetermined level, the mute stage becomes active. To avoid the 'ON/OFF' effect of the audio signal due to fluctuations of the input signal, the mute stage is activated rapidly but de-activated slowly. The mute stage is de-activated slowly, via a current source and an external capacitor at pin 2, to avoid aggressive behaviour of the audio signal. It is possible to adjust the '-3 dB limiting point' of the audio output via the level voltage due to the level signal being externally adjustable. If hard muting is required then pin 2 must be switched to ground.

The 8-bit counter allows accurate stop information to be obtained, because exact tuning is achieved when the measured frequency is equal to the centre frequency of the IF filter.

To measure the input frequency, the number of pulses which occur in a defined time must be counted. This defined time is referred to as 'window'. A wide window indicates a long measuring time and therefore a high accuracy. The counter resolution is defined as Hertz per count. Due to the TEA6100 having to measure the IF frequencies of AM and FM, the counter resolution must be adjustable (different channel spacing). The counter resolution depends on the setting of dividers 1 (N1), divider 2 (N2) and the reference frequency (F_{ref}). The divider ratios of N1 and N2 are controlled by software (see section PROGRAMMING INFORMATION). In Table 3 the window and counter resolution has been calculated for a reference frequency of 40 kHz. The accuracy is controlled by bit 7 of the input word. Although the resolution is the same for bit 7 = logic 0 and bit 7 = logic 1, the width of the window doubles when bit 7 = logic 1.

- bit 7 = 0, accuracy = $\pm$ counter resolution
- bit 7 = 1, accuracy = $\pm \frac{1}{2}$ counter resolution

Communication between TEA6100 and the microcomputer is via a two wire bidirectional I²C bus. The power supply lines are fully isolated to avoid cross talk between the digital and analogue parts of the circuit.

Notes to the characteristics

1. All characteristics are measured from the circuit shown in Fig. 13.
2. Conditions for this parameter are:
 $20 \log V_O(\text{FM}); m = 0,3$ or $20 \log V_O(\text{AM}); m = 0,3$.
3. Voltage source followed by diode and resistor.
4. A DC shift can be achieved by connecting a $1,8 \text{ M}\Omega$ resistor between pin 4 and pin 15.
5. Step size between trip levels:
 $(V_{\text{TH}} - V_{\text{TL}})/6 \pm 0,07 \text{ V}$.

APPLICATION INFORMATION

Fig. 13 Application diagram.

Fig. 14 Track side of printed circuit board.

Fig. 15 Component side of printed circuit board.

Double tuned circuit

$$\begin{aligned}
 R1 &= 5,1 \text{ k}\Omega, R2 = 1,5 \text{ k}\Omega \\
 C1 = C2 &= 150 \text{ pF (n = 220)} \\
 C3 = C4 &= 10 \text{ pF} \\
 L1 = L2 &= 1,6 \text{ }\mu\text{H}
 \end{aligned}$$

Fig. 16 Double tuned demodulator circuit.

Alignment of the circuit is obtained with an IF input signal $> 200 \text{ }\mu\text{V}$. Tuning the circuit is performed by, detuning L2, adjusting L1 to obtain a minimum distortion level and then adjusting L2 to obtain a minimum distortion level.

Fig. 17 Total harmonic distortion plotted against IF detuning;
for $\Delta f = \pm 75 \text{ kHz}$, $f_{\text{mod}} = 1 \text{ kHz}$ and $V_O = 500 \text{ mV}$.

PROGRAMMING INFORMATION

Converting the read out of the counters into frequency

The counter resolution at the input is defined as:

- resolution = divider ratio of $N2/\text{window}$

For every increment of the counter the counted frequency increases relative to the resolution in Hertz, as shown in example:

- window = 20 ms; $N2 = 128$; IF frequency = 10,7 MHz; resolution = $128/0,02 = 6,4$ kHz per count

The counter consists of 8 bits. Therefore, the maximum frequency range that can be counted is $256 \times \text{resolution} = 1,6384$ MHz. In the example the frequency to be counted is 10,7 MHz, therefore, the counter will overflow (in the example above, 7 times). The real measured frequency is:

- $f_{\text{real}} = (\text{read out} + \text{overflow} \times 256) \times \text{resolution}$

The overflow indicates the off-set on the frequency scale which must be added to the read out. Due to the bandwidth of the IF filter, the frequencies at the input to the TEA6100 are known, for example:

- IF filter for FM has a center frequency of 10,7 MHz and -3 dB bandwidth of 300 kHz. Only the frequencies of $10,7 \text{ MHz} \pm 150 \text{ kHz}$ occur at the input of the TEA6100. For this reason it is not necessary to count the overflow.

The read out of the counter has to be translated into frequency. This translation depends upon the counter resolution. The preferred way to calculate the input frequency is to:

- calculate the read out of the target IF frequency. Compare this value with that of the measured read out and multiply the difference by the resolution.

The formulae for calculating the target IF read out and the resolution are as follows (A, D, E, F and G refer to the bits of the I²C bus input data as shown in Figs 3 and 4 and to the counter/timer block diagram shown in Fig. 6. An, Dn, En, Fn and Gn are inverted values of the variables A, D, E, F and G. Table 3 shows the following formulae calculated for a reference frequency of 40 kHz):

- $N1 = (An \times 4 + A \times 5) \times (En \times 4 + E \times 5) \times 8 \times (2[E \times 2 + G \times 1]) \times (F \times 1 + Fn \times 8)$
- Window (T) = $N1/F_{\text{ref}}$
- $N2 = (E \times 16 \times 8 + En \times [Dn \times 1 + D \times 16]) \times (G \times 2 + Gn \times 1)$
- Target decimal read out (TDEC) = $T \times (\text{TIFF}/N2 + (E \times 247 + En \times 79))$. TIFF is the symbol for target IF frequency
- Target read out hexadecimal (THEX), convert the target decimal read out to hexadecimal and use the 2 least significant digits (Do not use overflow value). The symbol for measured hexadecimal is MHEX
- Resolution (R) = $N2/T$
- Measured frequency (F_1) = $(\text{TIFF}) + R \times (\text{MHEX} - \text{THEX})$

Note

Care should be taken if $\text{TIFF} + \frac{1}{2}$ filter bandwidth is greater than the frequency for the read out of hexadecimal value FF, or if $\text{TIFF} - \frac{1}{2}$ filter bandwidth is less than the frequency at read out for hexadecimal value 00.

- Counter accuracy (AW and AN), with bit 7 (G) the accuracy can be chosen with the same resolution. If bit 7 is logic 1 the accuracy is HIGH and if bit 7 is logic 0 then the accuracy is LOW.

bit 7 = 0, AN = $\pm (N2/T)$

bit 7 = 1, AW = $\pm (\frac{1}{2} \times N2/T)$

Example

The example uses the following values:

T_{IFF} = 10,7 MHz; accuracy = LOW (G = 0); F_{ref} = 40 kHz (A = 1); IF frequency = 10,7 MHz (D = 1); resolution = N1 (F = 1) and counter mode = FM (E = 1)

$$N1 = (0 \times 4 + 1 \times 5) \times (0 \times 4 + 1 \times 5) \times 8 \times (2^{[1 \times 2 + 0 \times 1]}) \times (1 \times 1 + 0 \times 8) = 800$$

$$T = 800/40 = 20 \text{ ms}$$

$$N2 = (1 \times 16 \times 8 + 0 \times [1 \times 1 + 0 \times 16]) \times (0 \times 2 + 1 \times 1) = 128$$

$$TDEC = 20 \times 10,7/128 + (1 \times 247 + 0 \times 79) = 1919$$

THEX; 1919 is hexadecimal 77F and the least significant 2 digits are 7F, so THEX = 7 F

$$R = 128/20 = 6400 \text{ Hz/count}$$

Assume the readout is '6E', the measured frequency will be:

- $F_I = 10,7 + (6E - 7F) \times 6400 = 10,59 \text{ MHz}$

Assume the readout is '83', the measured frequency will be:

- $F_I = 10,7 + (83 - 7F) \times 6400 = 10,726$

Purchase of Philips' I²C components conveys a license under the Philips' I²C patent to use the components in the I²C-system provided the system conforms to the I²C specifications defined by Philips.

TEA6200

INTEGRATED AM UPCONVERSION RECEIVER

GENERAL DESCRIPTION

The TEA6200 is an integrated AM upconversion receiver circuit with an IF of 10.7 MHz. Because of the high dynamic range of the RF prestage there is no tuned prestage. The whole selectivity is provided by crystal filters. The circuit is intended for use in AM radios with synthesizer tuning.

The TEA6200 can handle RF signals up to 2 V RMS.

Features

- No pre-tuned selection is required
- No LW/MW switching
- RF input is protected from static discharge from the aerial
- Electronic standby switch
- Voltage controlled oscillator for synthesizer tuning
- IF output providing level information for search tuning.
- No alignment required.

	1.25/1.4 MHz input noise level = -104 dBm	IMFDR 3	—	90	—	dB

Notes to the characteristics

1. The prestage is connected to the aerial by a 6 MHz low-pass filter that decouples unwanted aerial cable resonance frequencies. The large dynamic range of the prestage is achieved by use of a transimpedance amplifier with a feedback loop consisting of an equivalent aerial capacitance and a feedback capacitor. When large RF signals are received the feedback capacitance in the loop is increased and the gain subsequently reduced, (see Fig. 4).

$$\text{Voltage gain for small signals} \quad G_V = V_{rf} \times \frac{C_{ae}}{C_1}$$

$$\text{Voltage gain for large signals} \quad G_V = V_{rf} \times \frac{C_{ae}}{C_1 + C_2}$$

2. To protect the demodulator and the AGC circuitry, against parasitic oscillation in the IF section, a ceramic filter is connected between the IF output and detector input.

TEA6300
TEA6300T

SOUND FADER CONTROL CIRCUIT

GENERAL DESCRIPTION

The Sound Fader Control circuit (SOFAC) is an I²C-bus controlled preamplifier for car radios.

Features

- Source selector for three stereo inputs
- Inputs and outputs for noise reduction circuits
- Volume and balance control; control range of 86 dB in steps of 2 dB
- Bass and treble control from + 15 dB (treble 12 dB) to -12 dB in steps of 3 dB
- Fader control from 0 dB to -30 dB in steps of 2 dB
- Fast muting
- Low noise suitable for DOLBY* B and C NR (noise reduction)
- Signal handling suitable for compact disc
- I²C-bus control for all functions
- ESD protected

Purchase of Philips' I²C components conveys a license under the Philips' I²C patent to use the components in the I²C-system provided the system conforms to the I²C specifications defined by Philips.

FUNCTIONAL DESCRIPTION

The source selector selects three stereo channels — RF part (AM/FM), recorder and compact disc. As the outputs of the source selector and the inputs of the main control part are available, additional circuits such as compander and equalizer systems may be inserted into the signal path. The AC signal setting is performed by resistor chains in combination with multi-input operational amplifiers. The advantage of this principle is the combination of low noise, low distortion and a high dynamic range for the circuit.

The separate volume controls of the left and the right channel facilitate correct balance control. The range and balance control is software programmable.

Because the TEA6300 has four outputs a low-level fader is included. The fader control is independent of the volume control and an extra mute position is built in for the front, the rear or for all channels. The last function may be used for muting during preset selection. An extra pop suppression circuit is built in for pop-free switching on and off. As all switching and control functions are controllable via the two-wire I²C-bus, no external interface between the microcomputer and the TEA6300 is required. The on-chip power-on-reset sets the TEA6300 to the general mute mode.

<i>AC characteristics</i>					
in accordance with the I ² C-bus specification					
<i>Power-on-Reset</i>					
When RESET is active the GMU (general mute) bit is set and the I ² C-bus receiver is in RESET position					
Increasing supply voltage					
start of reset	V_{CC}	—	—	2,5	V
end of reset	V_{CC}	5,2	6,0	6,8	V
Decreasing supply voltage					
start of reset	V_{CC}	4,2	5,0	5,8	V

Notes to the characteristics

1. The indicated values for output power assume a 6 W power amplifier with 20 dB gain, connected to the output of the circuit. Signal-to-noise ratios exclude noise contribution of the power amplifier.
2. Signal-to-noise ratios on a CCIR 468-2 average meter reading are 4,5 dB better than on CCIR 468-2 quasi peak.

I²C-BUS FORMAT

S	SLAVE ADDRESS	A	SUBADDRESS	A	DATA	A	P
---	---------------	---	------------	---	------	---	---

S = start condition

SUBADDRESS = see Table 1

SLAVE ADDRESS = 1000 0000

DATA = see Table 1

A = acknowledge, generated by the slave

P = STOP condition

If more than 1 byte of DATA is transmitted, then auto-increment of the subaddress is performed.

TEA6310T

SOUND FADER CONTROL CIRCUIT

GENERAL DESCRIPTION

The Sound Fader Control circuit (SOFAC) is an I²C-bus controlled tone and volume control circuit for car radios.

Features

- Volume and balance control; control range of 86 dB in steps of 2 dB
- Bass and treble control from +15 dB (treble 12 dB) to -12 dB in steps of 3 dB
- Fader control from 0 dB to -30 dB in steps of 2 dB
- Fast muting
- Low noise suitable for Dolby* B and C NR (noise reduction)
- Signal handling suitable for compact disc
- I²C-bus control for all functions
- ESD protected

QUICK REFERENCE DATA

28	SCL	serial clock input (I ² C-bus)

FUNCTIONAL DESCRIPTION

The AC signal setting is performed by resistor chains in combination with multi-input operational amplifiers. The advantage of this principle is the combination of low noise, low distortion and a high dynamic range for the circuit.

The separate volume controls of the left and the right channel facilitate correct balance control. The range and balance control is software programmable.

Because the TEA6310T has four outputs a low level fader is included. The fader control is independent of the volume control and an extra mute position is built in for the front, the rear or for all channels. The last function may be used for muting during preset selection. The Fader function can be disabled by an input signal at FAF (pin 9).

An extra pop suppression circuit is built in for pop-free switching on and off. As all switching and control functions are controllable via the two-wire I²C-bus, no external interface between the micro-computer and the TEA6310T is required.

The on-chip power-on-reset sets the TEA6310T to the general mute mode.

RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)

parameter	symbol	min.	max.	unit
Supply voltage (pin 27-18)	V _{CC}	—	16	V
Maximum power dissipation	P _{tot}	—	1	W
Storage temperature range	T _{stg}	−55	+150	°C
Operating ambient temperature range	T _{amb}	−40	+ 85	°C

CHARACTERISTICS

$V_{CC} = 8,5 \text{ V}$; $R_S = 600 \Omega$; $R_L = 10 \text{ k}\Omega$; $f = 1 \text{ kHz}$; $T_{amb} = 25^\circ\text{C}$; test circuit Fig. 10; unless otherwise specified

Notes to the characteristics

1. The indicated values for output power assume a 6 W power amplifier with 20 dB gain, connected to the output of the circuit. Signal-to-noise ratios exclude noise contribution of the power amplifier.
2. Signal-to-noise ratios on a CCIR 468-2 average meter reading are 4,5 dB better than on CCIR 468-2 quasi peak.

I²C-BUS FORMAT

S	SLAVE ADDRESS	A	SUBADDRESS	A	DATA	A	P
---	---------------	---	------------	---	------	---	---

S = start condition
 SLAVE ADDRESS = 10000 0000
 A = acknowledge, generated by the slave
 SUBADDRESS = see Table 1
 DATA = see Table 1
 P = STOP condition

If more than 1 byte DATA are transmitted, then auto-increment of the subaddress is performed.

TSA6057
TSA6057T

RADIO TUNING PLL FREQUENCY SYNTHESIZER

GENERAL DESCRIPTION

The TSA6057/6057T is a bipolar single chip frequency synthesizer manufactured in SUBILO-N technology (components laterally separated by oxide). It performs all the tuning functions of a PLL radio tuning system. The IC is designed for application in all types of radio receivers.

Features

- On-chip AM and FM prescalers with high input sensitivity
- On-chip high performance one input (two output) tuning voltage amplifier for the AM and FM loop filters
- On-chip 2-level current amplifier (charge pump) to adjust the loop gain
- Only one reference oscillator (4 MHz) for both AM and FM
- High speed tuning due to a powerful digital memory phase detector
- 40 kHz output reference frequency for co-operation with the FM/IF system and microcomputer-based tuning interface IC (TEA6100)
- Oscillator frequency ranges of: 512 kHz to 30 MHz and 30 MHz to 150 MHz
- Three selectable reference frequencies of 1 kHz, 10 kHz or 25 kHz for both tuning ranges
- Serial 2-wire I²C-bus interface to a microcomputer and one programmable address input
- Software controlled bandswitch output

14	LOOP _I	tuning voltage amplifier input
15	AM _O	AM output for external loop filter
16	V _{CC2}	positive supply voltage

FUNCTIONAL DESCRIPTION

The TSA6057/6057T contains the following parts and facilities:

- Separate input amplifiers for the AM and FM VCO-signals.
- A prescaler with the divisors 3:4 on AM and 15:16 on FM, a multiplexer to select AM or FM and a 4-bit programmable swallow counter.
- A 13-bit programmable counter.
- A digital memory phase detector.
- A reference frequency channel comprised of a 4 MHz crystal oscillator followed by a reference counter. The reference frequency can be 1 kHz, 10 kHz or 25 kHz and is applied to the digital memory phase detector. The reference counter also outputs a 40 kHz reference frequency to pin 9 for co-operation with the FM/IF system and microcomputer-based tuning interface IC (TEA6100).
- A programmable current amplifier (charge pump) which consists of a 5 μ A and a 450 μ A current source. This allows adjustment of loop gain, thus providing high current-high speed tuning and low current-stable tuning.
- A one input — two output tuning voltage amplifier. One output is connected to the external AM loop filter and the other output to the external FM loop filter. Under software control, the AM output is switched to a high impedance state by the FM/AM switch in the FM position and the FM output is switched to a high impedance state by the AM/FM switch in the AM position. The outputs can deliver a tuning voltage of up to 10.5 V.
- An I²C-bus interface with data latches and control logic. The I²C-bus is intended for communication between microcontrollers and different ICs or modules. Detailed information on the I²C-bus specification is available on request.
- A software-controlled bandswitch output.

Purchase of Philips' I²C components conveys a license under the Philips' I²C patent to use the components in the I²C-system provided the system conforms to the I²C specifications defined by Philips.

FUNCTIONAL DESCRIPTION (continued)

Controls

The TSA6057/6057T is controlled via the 2-wire I²C-bus. For programming there is one module address, a logic 0 R/W bit, a subaddress byte and four data bytes. The subaddress determines which one of the four data bytes is transmitted first. The module address contains a programmable address bit (D1) which with address select input AS (pin 12) makes it possible to operate two TSA6057s in one system.

The auto increment facility of the I²C-bus allows programming of the TSA6057/6057T within one transmission (address + subaddress + 4 data bytes).

- The TSA6057/6057T can also be partially programmed. Transmission must then be ended by a stop condition.

The bit organization of the 4 data bytes is shown in Fig.3 and are described in sections (a) to (f).

- (a) The bits S0 to S16 (DB0: D7-D1; DB1: D7-D0; DB2: D1-D0) together with bit FM/AM (DB2: D5) are used to set the divisor of the input frequency at inputs AM_I (pin 7) or FM_I (pin 5). If the system is in lock the following is valid:

FM/AM	input frequency (f _i)	input
0	$(S0 \times 2^0 + S1 \times 2^1 + \dots + S13 \times 2^{13} + S14 \times 2^{14}) \times f_{ref}$	AM _I
1	$(S0 \times 2^0 + S1 \times 2^1 + \dots + S15 \times 2^{15} + S16 \times 2^{16}) \times f_{ref}$	FM _I

Where

The minimum dividing ratio for AM mode is $2^6 = 64$

The minimum dividing ratio for FM mode is $2^8 = 256$

- (b) The bit CP is used to control the charge pump current (DB0: D0).

CP	current
0	low
1	high

- (c) The bits REF1 and REF2 are used to set the reference frequency applied to the phase detector (DB2: D7-D6).

REF1	REF2	frequency (kHz)
0	0	1
0	1	10
1	0	25
1	1	none

- (d) The bit $\overline{\text{FM/AM}}$ OPAMP controls the switch AM/FM; FM/AM in the tuning voltage amplifier output circuitry (DB2: D4).

$\overline{\text{FM/AM}}$ OPAMP	switch FM/AM	switch AM/FM
1	closed	open
0	open	closed

(e) The bit BS controls the open collector bandswitch output (DB2: D2).

BS	bandswitch output
1	sink current
0	floating

(f) The data byte DB3 must be set to 0 0. It is also used for test purposes.

μ A758

FM Stereo Multiplex Decoder, Phase-Locked Loop

Product Specification

DESCRIPTION

The μ A758 is a monolithic phase-locked loop FM stereo multiplex decoder. The device decodes an FM stereo multiplex signal into right and left audio channels while inherently suppressing SCA information when it is contained in the composite input signal. The device includes automatic mono-stereo mode switching and drive for an external lamp to indicate stereo mode operation.

The μ A758 operates over a large voltage range and requires a minimum number of external components. A simple setting of an external potentiometer adjusts the oscillator frequency. No coils are required.

FEATURES

- 45dB channel separation
- Automatic stereo/mono switching
- 70dB SCA rejection
- 10V to 16V supply range
- High impedance input—low impedance output

APPLICATIONS

- Stereo decoder for radios

SOLDERING

For type numbers with prefixes:
HEF, MAB, MAF, OM, PCA, PCB, PCF,
PNA, SAA, SAD, SAF, TDA, TDB, TDD, TEA and TSA

SOLDERING PLASTIC MINI-PACKS

1. By hand-held soldering iron or pulse-heated solder tool

Fix the component by first soldering two, diagonally opposite end leads. Apply the heating tool to the flat part of the lead only. Contact time must be limited to 10 seconds at up to 300 °C. When using proper tools, all other leads can be soldered in one operation within 2 to 5 seconds at between 270 and 320 °C. (Pulse-heated soldering is not recommended for SO packages).

For pulse-heated solder tool (resistance) soldering of VSO packages, solder is applied to substrate by dipping or by an extra thick tin/lead plating before package placement.

2. By wave

During placement and before soldering, the component must be fixed with a droplet of adhesive. After curing the adhesive, the component can be soldered. The adhesive can be applied by screen printing, pin transfer or syringe dispensing.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder bath is 10 seconds, if allowed to cool to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

3. By solder paste reflow

Reflow soldering requires the solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the substrate by screen printing, stencilling or pressure-syringe dispensing before device placement.

Several techniques exist for reflowing, for example, thermal conduction by heated belt, infrared, and vapour-phase reflow. Dwell times vary between 50 and 300 seconds according to method. Typical reflow temperatures range from 215 to 250 °C.

Pre-heating is necessary to dry paste and evaporate binding agent.

Pre-heating duration: 45 minutes at 45 °C.

4. Repairing soldered joints

The same precaution and limits apply as in (1) above.

SOLDERING PLASTIC DUAL IN-LINE PACKAGES

1. By hand

Apply the soldering iron below the seating plane (or not more than 2 mm above it). If its temperature is below 300 °C it must not be in contact for more than 10 seconds; if between 300 and 400 °C, for not more than 5 seconds.

2. By dip or wave

The maximum permissible temperature of the solder is 260 °C; this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified storage maximum. If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

3. Repairing soldered joints

The same precautions and limits apply as in (1) above.

SOLDERING TAB MODULES

1. Fluxing

- (a) a flux that does not have to be removed,
or
- (b) a water-soluble flux.

2. Soldering

The reflow soldering method using a pulse-heated soldering tool is usually suitable. Limit the soldering operation to 3 seconds at 250 °C at the leads.

3. Cleaning

Avoid cleaning if possible.

If cleaning is necessary, use cold or hot water.

A detergent may be added to the water. Finally rinse with de-ionized water.

Do not use ultrasonic cleaning methods as these may damage the inner or outer leads.

Do not use solvents.

NOTES

NOTES

NOTES

The Philips Components technical handbook system... a comprehensive data library

The Philips Components handbook is made up of four sets of books, each comprising several parts:-

Book 1	Semiconductor devices
Book 2	Electronic tubes
Book 3	Components, materials and assemblies
Book 4	Integrated circuits

Most of the devices for which full data is given in these books are those around which we would recommend equipment to be designed. Where appropriate, other types no longer recommended for new equipment designs but generally available for equipment production, are listed separately. Data sheets for these types may be obtained on request.

The current Philips Components Quick Reference Guide should always be consulted for details of our preferred range.

The data contained in these books is as accurate and up to date as possible at the time of going to press. It must be understood, however, that no guarantee can be given on the availability of the various devices, or that their specifications may not be changed before the next edition is published.

Each part is reviewed regularly, revised and re-issued where necessary. Requests for copies of the Quick Reference Guide and individual data sheets (please quote the type number) should be sent to:-

Technical Publications Department, Philips Components Limited,
New Road, Mitcham, Surrey CR4 4XY. Telex 22194.

Prices and availability information for our products can be obtained from Mullard House, or from one of our Distributors listed on the back cover.

Philips Components Data Base

For the equipment designer, technical information on electronic components is vital. Philips Components markets the widest range of electronic components in the UK, supported by a comprehensive information service – the Philips Components Data Base.

Brief details are given here. For further information, please write to:

**Technical Publications
Department,**
Philips Components
Limited,
New Road, Mitcham,
Surrey CR4 4XY.

Philips Components News

A must for designers, this bi-monthly newspaper-style publication, describes new components and offers further information on subjects of interest. Make sure your name is on our mailing list.

Consumer Electronics

A review, in newspaper style, published every four months. It features articles and news items of interest to those in the consumer electronics industry, with an emphasis on television technology and allied subjects.

Prestel too!

Electronic Components and Applications

A quarterly technical journal covering, in depth, developments in electronics based on the work of Philips laboratories worldwide.

Quick Reference Guide

This lists all components marketed by Philips Components, together with brief data.

Technical Publications, Brochures and Catalogues

Philips Components publishes a wide range of publications on electronic components and their applications. New publications are described and offered in Philips Components News.

Technical Data Service

This service provides detailed up-to-date information on the characteristics and performance of Philips components. Subscribers receive all relevant handbooks, loose-leaf binders, a monthly mailing of new data, and new handbook parts as they are published.

For those not wishing to subscribe to the Data Service, handbook parts can be purchased individually.

Individual data sheets are available free-of-charge and can be obtained by quoting the type number.

Prestel

Philips publications can be ordered via Prestel. The Philips Components data base begins on page 53389.

Philips Components Data Base: Prestel 53389
